Alan,

I'm glad that you located it. I haven't gotten around to looking yet. Every
week that passes seems to find me a week and a half farther behind.

On the BC-611, the only way to know whether a chassis is working is to fire
it up, test it and if necessary repair it. I simply don't have the time to do
that. If the thing works perfectly, it will take 2 or 3 hours start to
finish. And odds are there will be at least something needing repair, most commonly
the audio output capacitor. Which is another hour. The best I could do on a
bare chassis is make sure there's nothing obviously wrong. If you really
mean a complete radio and not just a chassis, your best bet would be to find one
on eBay that as far as you can tell isn't a basket case, buy it, find out what
parts are missing (there are almost always some as most sellers are clueless,
and fix it. I would try to avoid the BC-611-F because it is not uncommon to
find one or more open coils in the IF transformers. And although I once had a
good stock of replacements, I am about to use my last one.

# 3312. T-368 Bias Disaster

Yahoo group: T-368_BC-610
Date: 2008-07-11 14:39:18 UTC
From: Keith Densmore
Topic: 3312  Message: 3312

Hello All,
I've been off this list since Febuary, with a move to the frozen North. It's great to be back!
For what it is worth---
I had an experience with the T-368 that was not pleasant. In the process of getting the transmitter settled in it's new home, I did an alignment, and changed out the final and 6000 driver. All was well, she was putting out about 400 watts. The next time I powered it up, no drive, no output. Investigation showed a brand new 6000 tube with visible signs of damage (ouch!). Turns out the bias 5R4 rectifier failed, taking the 6000 with it. Had it been in AM, the modulators might have suffered the same fate.
Most high power transmitters I have seen have a cut out relay in the bias line as part of the interlock. No bias, no B+ voltages. But the T-368 does not do this.
Here's Murphy's lesson on this one--solid state the 5R4 bias line rectifier and/or install a interlock relay which runs off the bias voltage.

73 all,
Keith ve3ts

Alan,

OK. When you do find the radio, if it is missing parts or some are in poor condition, let me know what they are. Although I don't have all that I once had, I do still have a few of the commonly needed ones.

Hello Again,
The large blower motor on my T-368 is making noise consistent with bad/ or unlubed bearings. (Metallic whine).
I've never attempted to repair or replace bearing on an electric motor. Is it difficult? Anyone on the list done it with that back blower?

Thanks All, 73,
Keith ve3ts

Topic: 3314  Message: 3317

Hello to the Group,
I joined this list some time back, not because I own either a '610 or a '368, but because I hope to one day. I say this because I don't have any experience with these transmitters but I see a potential for a repair job that end in difficulty.
This is in regard to your bearing problem...if I experienced that here in central Indiana, I believe it would be cost effective to remove the motor and take it to an electric motor specialist. What they can generally do in minutes, it would take me quite a bit longer plus the problems I might incur while disassembling a motor. It is a bit of a specialized work. I would think bearings would be quite a bit more universal than perhaps other areas of these big transmitters.
I see by your call you're a ve3. Wouldn't you have an electric motor shop in your area?

Its not too bad to do, if you have trouble getting the old bearings off the shaft, or getting the new ones on, take it to a machinist and he can press them off and on in a few minutes then you can take the shaft home and put it all back together again.

Joe may have gone to bed. I should have, too, but that's another story.

No, what Joe meant was that he repeated Byron's 610 related post to the 610 list since Byron isn't subscribed. Tom sent Byron a response (he thought). But it only went to this list unless Tom manually copied Byron.

I guess somewhere on my forehead, it's stamped 'STUPID' and everyone
thinks I need things explained.

Your reply to me was out of context in how I intended my comment (which,
admittedly,should have had a 'smiley' face, for folks to better understand).

Someone get Byron's address, please?

Group,
 I just put the lower motor back together with the replacement bearings.
 Wow, what a difference.  Apparently the bearings are very standard parts.
 A machinist  friend had a bunch in a  parts drawer.
 The one I got are not sealed like the original.
  I just washed the stored years of dust out of them in kerosene and then packed them with grease.
  Rewired the motor back in and fired it up on a cheater cord.
  Massive improvement in the noise reduction.
  Hardly took any time to do the R&R.
  Just a nut and bolt job. I didn''t have to pull the bearing off - I just set the jaws of a set of pliers across one side and tapped it with a hammer. It popped off.
 Similarly, the new bearing settled back on the shaft without much force.
 If you are faced with  a noisy blower, don't be afraid to tackle it.

Hi Folks,

Was wondering if anyone has had trouble getting good audio quality from their T-368?

I HAVE DONE the usual audio mods and get great audio to the grids of the modulator tubes, but then
seem to lose the quality in the mod transformer.
Wondering if the mod transformer was designed to cut off below 600 HZ?

Anyone have a similar experience with the T-368?
Regards,
Jay W7PJS

Jay,

My T-368 is 100 percent stock, both in RF and Audio sections. I use either a carbon mic, such as the H33 Handset, or a D 104, with homebuilt 2 transistor preamp, powered by the bias for the carbon mic. I get great audio reports when using this set up. The military guys like the carbon mic audio though. It is a C model, built by Crosley. I have not been able to find the audio specs on the Mod Transformer, but have never heard of anyone complaining of Low Freq Response problems due to the transformer.

Jay,

I've got two of the beasts. In some admitedly quick and dirty tests a number of years ago I noted the audio seemed to start dropping off on the low end around 500 cps and was down a couple of db at 250, but at the time was primarily interested in high end drop-off due to the rather large shunt capacity the design puts across the secondary of the mod xformer. Did the usual mods in the speech amp (bypass clipper filter, bigger coupling caps, etc.) but not the "Timtron" mods in the PA. Use an electret mike and people give me good to VG audio reports on the air. Several other T3's operating in SOCAL too that sound FB.

Guess it all depends on what you mean by "good" audio. These sets are never going to sound like one of the old BC rigs a lot of guys use. Have you been getting on the air complaints?

Would suggest contacting Tim Smith ,WA1HLR, as he is very knowledgeable in the area of AM modulation. I have a T368C by B&W which has many of his mods. There are several changes that must be made in the RF deck that will make a world of difference.

See the RF Deck mods at: http://r-390a.us/T368.htm

BTW this T-3 is now sitting in my shack rather than Walters. But I followed his suggestion and did nothing more than plug an unamplified D-104 into it, and I've had consistently good comments on the audio quality.

From: Tom Mackie
Topic: 3332  Message: 3338

Jay,

I did some very simple speech amp mods:

Match the mic to the input tube.

Bypass the clipper, FL1 and FL2

Used a 50uf cap bypassing R31

Changed C40 to .1

Bypass R40 with 100uf

And I fooled with some shaping and finally settled with 27k in series
with a .0003 across R36.

None of this was very scientific.

But the biggest changes I got were taking HV off the output network and
removing some of the capacity in the tank. I installed a new choke near
the 4-400 and shifted things around a bit.

It was easy to do if thought out ahead of time and mimic RF deck mod
ideas from this:

http://home.att.net/~r391/www_ott/t368.htm

The speech amp changes didn't come alive until I reworked the RF deck.
It has plenty of modulation and I seem to get good reports.

Overall these were very low impact, easily done modifications that made
a nice change in the sound.

The other benefit is that it tuned up more smoothly.

73

Yep,
He is correct! I have the BC-375 which uses the PE-73-C . The rig I used to
have
was the BC-191, which uses the same plug-in tuning units, The Dyno-motor
there
is the BD-77, I may even still have the unit, would have to look.

In both cases however, the HV requirement is the same.

Oh yes,
Way back in 1969, while recuperating, I acquired a full system, so
I could get on 80 meters AM with the W2OY Gang. They let me in
for a short time, then "Mr Premus" (sp) drove over to my house and
chewed me out, and asked what the Heck I was doing running the
BC-191. I told him to be patient, two weeks later the 18 wheeler
delivered my station equipment from Germany, 3 BC-610(H&I) rigs
along with the BC-312/342 receivers. He was a little gentler then.

Mike had a way about him, that I will always remember. Called me
"The Kid", even though I was freshly back from Military Service.
I miss him, and his antics.

Yep,
He is correct! I have the BC-375 which uses the PE-73-C . The rig I used to
have
was the BC-191, which uses the same plug-in tuning units, The Dyno-motor
there
is the BD-77, I may even still have the unit, would have to look.

In both cases however, the HV requirement is the same.

Hey Jim -

I have a small sound file of Mike if you'd like it. Calling CQ and ending with something like 'no matter how good you think you are with the pho-netics, we don't want ya, noooooo'. It's on AMfone too, I think. Herb K2VH tells some amusing stories as well, about himself, Dick W2UJR, and Mike. He has a photo with Mike standing next to one of the 'kids', arm around his shoulder, with a big grin. A lot of his 'antics' apparently were just that; he wasn't the 'big meanie' some thought.

From: Joe Munson
Topic: 3353  Message: 3353

I am in need of the wiring diagram for the connection between the BC 191 and the BC 312. If anyone needs it, I have the Cording Diagram for the SCR 187A, that is between the BC 191 transmitter, BD 77 Dynamotor, Radio Control box BC 309, and the BC 224 receiver.

Thanks in advance,

Joe Munson

No Warren, I was careful to say 'a lot of his antics', not all. I'm aware that there were other issues by reports from you and others, as it was indeed before my time. Irb W2VJZ was the Mike of our generation, often times politically or racially motivated, sometimes amusing and friendly, other times cozying up to a QSO to call CQ, even having one-sided conversations to somehow justify his antics. He said and did some things that I strongly disagreed with, but he was still a part of the AM scene for decades, and left us with some downright funny memories as well - despite his frequent constitutional preaching and occasional racial rants. Irb was Irb, Mike was Mike, you took them as they were.

From: wa5cab@cs.com
Topic: 3353  Message: 3355

Joe (& Marty),

Cording and wiring diagrams for the SCR-193-(*) are in TM 11-273. 4/12/41 edition covers -A through -E. 5/02/45 covers -D through -U + -KB & -KW. The suffix letters are vehicle specific, a carryover from the pre-war practice of assigning specific letters by vehicle. I think that stopped with the SCR-193, after which it was a generic radio set to order, plus an installation kit by vehicle.

The -A, -B and -C models were set up to use Control Box BC-321. The -B also used BC-309. D and higher show no control boxes and no usage of the 4-pin PL-74.

The -D and higher cording diagrams differ only in cable nomenclature and length. I can scan the necessary pages. If you are doing a setup for a specific vehicle, let me know which. Or if you have and want to use BC-321 or it and BC-309, let me know. Or if you have any single-ended cables let me know the CD number(s) so I can be sure to scan the page that lists them.

I am prone to think it was the really rediculuous use of phonetics
by SOME of the radio operators of that time span. I could
certainly empathise with that, after learning the reason for the
phonetic alphabet in the military.

On 3880 during that time you could actually hear "Newbi-s"
using phrases like Wild Buffaloes 2, Wolly Buscuits 2, that
would annoy anyone enough to make them want to retaliate
in some way to proper register their ire!

Personalities are the property of the people carrying them.
As to the "AM" aspect of the conversation, some "Antics"
are just a bit more outrageous than Mikes', I for one never
heard him swearing on the air, nor taking a leak to impress the
"Gang".

Of course, others may have a different view! FWIW

Welcome to the group, John.

THIS is the place, where you could probably find something like that.
Best of luck!

And, if you're not too particular on an 'exact' replica, there's
probably some other transformer that will meet the specs that will
physically fit. The potted transformer that Perry/W5KGZ has now seems
to work fine, and it's not an exact either.

I wonder if anyone is still doing transformer re-winding, now that Peter
Dahl is out of business?

see you on the air in the AM (Saturday).

I "might" have one. I parted out a badly butchered -E years ago and still have some of the transformers but don't specifically recall which ones. It may be a week or so before I next go to my storage building but I'll check when I do.

The practical problem with using a transformer from a -F or later is mechanical. The terminals are below the chassis and the transformers only have one mounting flange. Otherwise one of those would work.

# 3361. New Member Introduction from Jeff W8CQ

Yahoo group: T-368_BC-610
Date: 2008-08-02 01:27:57 UTC
From: Jeff Weinberg W8CQ
Topic: 3361  Message: 3361

Hello Everyone,
I wanted to drop an email to say hello and introduce myself. My name is Jeff Weinberg and the call is W8CQ.

I have been following some of the threads, and with the blessing of the moderator, I have some information for all of you concerning Peter Dahl transformers. I am the person who took over the company from Peter about 5 months ago. I have moved most of the operations here to my small shop in Ohio. Until I get my new shop built, I am in partnership with MagCap Engineering to build and sell the complete line of Peter Dahl transformers and associated magnetics. As part of Peter selling the company to me, I own all of the designs and blueprints to all of the magnetics Peter used to sell.

Enough about that. A friend of mine is going to have me wind up a mod transformer for a T-368 and I notice that quite a few other folks may also need that particular unit. Right now I am in the process of obtaining the electrical specifications for this unit. If anyone has the original specs or good modified specs they would be willing to share, I can use them to design a replacement mod transformer for the T-368.

What I am proposing is that the more people that may need this or any other transformer or choke get together and place a group order as I can keep the pricing much lower on an order or more than 1 unit. This is goes for a replacement power transformer for the T-3 or any other parts for the BC-610 or T-3.

Again, just wanted to say hello and let those of you who did not know that Peter Dahl transformers are still available.

If you have any questions or I can help any of you, please contact me directly. Also, thanks for allowing me to post this Joe.

Jeff- I don't need any "big iron" transformers (as far as I know, and I hope it stays that way) but wanted to say "thanks" to you for picking up the PW Dahl lineage. This stuff does not come cheap, especially in these days of skyrocketing ferrous and copper costs, but to serve the niche, limited production, big iron markets you just stepped into (especially in light of those skyrocketing raw materials costs) it's gotta be more of a labor of love than about chasing the big or fast bucks. I'm sure you're savvy enough that you're not going to run it at a loss, but keeping the production going at all is a HUGE service not only to those of us who mess with this stuff, but, in the long run, to others who may need the technology and capability for yet-unidentified functions.

Hello to the Group,
Jeff's email shows a true blue attitude towards keeping ham radio suppliers operating in the very spirirt of the hobby.
I thank Jeff for his very positive outlook and certainly hope his vision of keeping this particular line of parts available will bring him great success in the future.
(This is not a commercial - just an observation from the sidelines.)

I was under the impression that they simply weren't taking any new orders, and that when those orders were filled, then that was gonna be 'it'.

I do recall hearing something about someone else taking over the rewinding business... The company might still be there, but I think the original owners aren't, anymore.

Hi Gents,

When there is no other choice then to work on the modulation deck with power connected (being extremely careful due the HV present) are cable and connector extensions the only way to do this or will the original cable connectors reach?

Are such extensions available?

Suggestions appreciated!

Thanks

Hi Jay. It depends on what you want to work on. If the speech amp input and all circuits up to the grids of the mod tubes are the work area you can remove the entire deck from the slide out cab. The present connecting cables will not be long enough to let you remove it soooo disconnect them being careful to lable so you can replace them to their respective terminals...then I use a ac jumper cord to feed ac to proper power transformer primary and that way yoou will activate the bais and the hi voltage to the 2A3 without applying any to the rest of the circuit...that will let you feed a audio input sig to the 2A3's so yoou can check the audio sig to the grids of the 100th's for distortion or the likes....Hope this has been helpful..I just finished two 610's one E model and one I model and that is the way I checked both for audio response it worked for me and I hope it will for you Please let me know the results.....
PS it is work anyw ay you look at it.

Jay,

If you're talking about ALL power including the 2500 volt HT, then extension cables would be one way to do it. Have never seen extension cables but presume that these or an equivalent test bench arrangement would have been available at some depot level. The speech amplifier is removable so setting up a bench arrangement with 115 vac and B+ connections from an external supply would give troubleshooting access up to the modulator grids. You could also get in-place above chassis access by removing the back panel and jumpering the interlock switch and test leads can be brought out through the now open back of the set from under chassis circuit points. Goes without saying that appropriate safety and insulation issues would have to be observed here.

BTW, just what are you doing that requires this kind of access?

Jay,

The modulator in the T-368 was designed to operate AB1 and as such the grids of the 4-125 modulator tubes do not "load" to the speech amp driver, i.e., no grid current is drawn. Any attempt to drive the grids positive (AB2 operation) will only result in chipping. The little 6C4 (and equally small driver transformer) are not capable of providing any power to the 4-125 grids and the circuit was not designed to do so. Accordingly, if you want to sweep the speech amp to determine it's frequency response you can do this outside the modulator chassis on the bench and get accurate results.

Don't know if there's room on the mod chassis for a KW-1 xformer or not, but might be worth a try.

Good luck.

I can get you the exact impedance ratio, tomorrow. I'm using one of those transformers in my home brewed 250TH modulator. As for some other information on the aforementioned transformer, a rather authoritative figure in the world of AM radio has -this- to say about the T-368 mod transformer:

[AMRadio] Re: T3 Mod Iron Specs

D. Chester
Thu, 21 Feb 2008 08:25:39 -0800

Anyone know the approximate "designed" frequency range for a T-368 modulation transformer?

Brian / wa5am

The frequency range of the standard T-368 mod-transformer is 300 - 3500 CPS. The mod iron is rated for 250 watts MAX., with a peak working voltage of 5000, and max altitude operating range of 10,000 ft. Maximum

rated carrier power out of a standard T-368 400 Watts AM voice, and AM FSK,

and 450 watts CW/FSK. NOTE: that is two different ratings for FSK mode.

Jim> WB2FCN

We all know that a modified T-368 can do much better than that. It is not unusual for a transformer to vastly exceed the nominal frequency response given in the specs. 300-3500~ is the minimum guaranteed response, +/- a given number of dB's. If the actual transformer exceeds that, it still meets those contracted specs. I once used an audio driver tranformer, made by Chicago Transformer Co, with those same exact specs stamped on the case, but the thing was actually flat from well below 100 Hz to beyond 7 or 8 kHz. So unless you plan to run "communications grade" audio, those specs are meaningless, except for giving you an idea of how poor the response might be. In many cases, I suspect the communications-grade transformer comes from the same stock as similar transfromers rated for broadcast or other higher audio quality applications, and the company simply stamped the minimum ratings spelt out in the contract, instead of going to the expense and trouble of

modifying an existing design to degrade its frequency response down to communications grade, unless the customer specifically demanded it. After all, what would be objectionable about shipping out a lower cost product whose quality is actually superior to what was called for? To determine the real response, you need to test the transformer with a signal generator. Load the secondary with the specified resistive load. Put maybe half the specified primary impedance in series with the primary, and connect to the generator. Sweep the frequency response using a scope or good audio level meter. Many VOM's have a calibrated dB scale. You will need a generator capable of delivering enough voltage to get a good reading on the scope or meter. You may be surprised how good the response on that transformer is. IIRC, the BC-610 audio is specified at 100-5000~, and I suspect that transformer will turn out at least as good.

Let's say your transmitter is limited for 200 to 3000 cycles in the audio section, either by coupling caps, cathode bypass, cathode resistors, plate loading, and any transformers... what is the result of using an external EQ and audio chain that pumps audio from the mic that is beyond either end of the audio range the transmitter is allowed by design to pass?

I think this is a common mistake that a lot of us make that can cause some serious harmonics and other artifacts.

According to the engineering data included in one of my UTC catalogues, they recommend that the flat frequency response of an audio transformer should extend one octave above and one octave below the intended frequency response expected from the amplifier, to assure that the audio waveform coming out of the transformer is close to identical to what is fed into the transformer. Low frequency phase shift may alter the assymetry of the voice waveform, and, with a pushpull amplifier, high frequency phase shift may result in objectionable distortion caused by one side of the pushpull circuit not being exactly 180 degrees out of phase with the other. You can test the phase shift response of a balanced transformer with an oscilloscope. Feed audio into the transformer with a wide-range audio signal generator. On each balanced primary or secondary winding, connect the ground side of the scope to the midtap of the transformer winding, and connect one end of the winding to the horizontal input to the scope, and the other end to the vertical input. Adjust both horizontal and vertical gain for equal deflection on the scope tube. If there is no phase shift, you should see a straight diagonal line. If there is phase shift, the diagonal line will expand into an elongated oval shape. In the worst case, with 90 degrees of phase shift, the pattern will become a perfect circle. If it is a pushpull grids to pushpull plates transformer, run the test with both windings, by reversing primary and secordary and re-running the test. If there is a balanced 500/600 ohm output with a midtap, run the test with that winding as well. While you may not even use the midtap, the test will nevertheless give you an idea of the phase linearity of the transformer. Throughout the useful frequency range of the transformer, you should see the straight diagonal. At either end of the

response, it will begin to fatten out into an oval. If there is any nonlinearity, which may occur at the extreme ends of the response curve, the diagonal line may show curvature or zig-zag, or the oval may change into an irregular shape. I have accumulated a fair number of UTC Linear Standard series audio transformers, whose rated specs are typically 20-20,000 Hz, with some better than that and some not quite rated that good. In the vast majority of cases, I have detected phase shift above about 11,000 Hz, as well as dips and peaks in the response beyond that frequency. I have some older ones that begin to drop off and show erratic response above 6000~. I have found the same thing with broadcast quality Thordarson and Chicago transformers. But I have seen some that actually did meet their nominal specs. The tests I mentioned above are all without any DC through the secondary of the transformer. If the T-368 transformer shows disappointing low frequency response or phase shift, you might be able to improve its operation in a transmitter by using an adequate modulation reactor and coupling capacitor, to take the DC off the secondary. OTOH, if the tests give good results, the characteristics my degrade considerably when the transformer is run in a transmitter with full DC through the secondary.

Groups,

A friend of mine, Jon K1VVC, email jonweiner@... who is not a member of these mailing lists, has a nice TN-339 antenna tuner for sale. These are the antenna tuners for the T-368 which were the remake with the new nomenclature - of the BC-939 antenna tuners which were used with the BC-610.
Jon's TN-339 is in great shape, the case is refinished with non-military paint but it's fairly close to the T-3 color. The electronics are in great shape inside, the chassis is very clean. Also, the military ID plate is missing.
Jon would like $200 for it, and prefers pickup (he is in Greer, SC, near Greenville and Spartanburg, not far from I-85). He'd ship it if he has to...

This is all I know about the tuner. PLEASE - do not email me with inquiries, email directly to Jon K1VVC jonweiner@... .

Thanks,

Meir,

I have an Instruction Book on the BC-307-B, reprint $20 plus ship. But I
have no idea what if any the differences were between the A and B models.

if Bob does not, or in case it's a help, the slang term for those jack socket covers here in the US is "toilet seats" and I think you might find some here; the wrinkle ones look a lot like what came on the BC series receivers

# 3384. Junction Box JB-70

Yahoo group: T-368_BC-610
Date: 2008-08-20 18:54:23 UTC
From: n8zfm
Topic: 3384  Message: 3384

Hi all, I'm new to the list and just acquired a BC-610-I, 614, 939 and a 342. What I don't have is a JB-70 Junction box and it would be nice to have to cable it all up just as the Army originally had it. Does anyone have a JB-70(A) they would be willing to part with, or know of someone who does?

I could also use some tank coils, I have a full set of tuning units. but only the one 80M coil.

I hope to get the beast on 80M soon, I've wanted one of these since I saw one in operation as a kid. Now I have a real honest to god boatanchor! Beautiful piece of equipment.

Thanks, 73 - Dave N8ZFM

# 3387. Very Big Plate Transformer available

Yahoo group: T-368_BC-610
Date: 2008-08-22 14:42:07 UTC
From: Trevor
Topic: 3387 Message: 3387

Hello all- not T-3 specific, but I know that many of you also are into other "big iron" and fraternize with others who have incurable thirst for ferrous materials.

This is a chance to save a nice piece of big retro HV iron from being melted down and shipped overseas as scrap.

A non-ham friend of mine has a brother who just bought the house (in VT) of a former (SK) ham. Only one item of equipment remained- the family had taken the rest. It's a huge plate transformer- 3 phase.

My friend is an engineer, so he had his brother oopy the nameplate specs, which are:

Federal Telephone & Radio Corp

Newark, NJ

Ser No 33022

Sec. T5CB

Type RC-8411-2

KVA 7.42

CYC 50/60

PH 3

C Rise 5.0

PMS

Test 1.5/7.5 kv

PRI 200/210/220/230/240

Sec 2280v

Spec

No 905

It sounds like it was in a box, so it may even be unused, but I am unsure, as I have not seen it first hand yet.

The fellow who has it would like to send it- preferably sell it to a good home (and have the buyer handle the coming-and-getting, as it's apparently barely-liftable, even by my friend, who happens to be a serious weight-lifter)

Use me as the contact point, and feel free to cross-post this to other lists where "big iron" types hang out, and I'll relay legit inquiries to the fellow who owns this beast

# 3390. FS: Scarce T-946/GRC-129 Transmitter

Yahoo group: T-368_BC-610
Date: 2008-09-04 13:31:53 UTC
From: John Poulton
Topic: 3390  Message: 3390

Folks,

I'm posting this for a non-lister, in hopes this rare and interesting
transmitter can find a good new home out there on the left coast!

**********
For sale: Scarce T-946/GRC-129 transmitter. This rig is essentially
a T-368 modified for SSB operation. The power supply deck is nearly
identical to the original T-368. The modulator deck has been stripped
of everything except the speech amp and LV power supply. The RF deck
is completely redesigned, with a SSB exciter in place of the original
T-3 exciter, and a PL172/8295A PA tube in place of the original 4-400.

The transmitter appears to be complete and is in fairly good condition, but
will require some work to get going. Cosmetic issues are mainly
spotty surface rust and dirt. Pictures at:

http://www.jptronics.org/pix/t946

Owner is asking $400 for the rig, which is located in McMinnville, Oregon.
Local pickup only. Contact Terry at 503-472-5772

w7tlt@...

**********
Don't return mail to me! I'm only the messenger.. :)

Interesting pics, first time I've seen inside one. Looks like it would
clean up pretty well. Sure would like the shockmount base for my T-3!

If anyone goes after this transmitter, be sure to visit the Evergreen
Aviation museum while there. The Hughes H-4 Hercules and a lot of
other nice planes are there, in a nice setting near a smaller town.

Yes, thanks John - although I really coulda used that shockmount base
on that transmitter you saw in the garage. Better to find a home for
the whole transmitter, if possible.

Terry, if you're going to part it out, I'd really like the shockmount base for my T-368. The shocks should easily unbolt from the bottom of the cabinet, once it's empty.

Might also be interested in the power supply panel if no one takes the whole drawer. Mine is pretty rough.

Thanks -

OK .... guess I must have missed the previous posting
listing it for sale. Been busy dealing with tropical
storms. Too bad .... I would have been interested in
at least attempting to rescue it unless the price was
totally out of wack. Main challenge would be to get it
from I "Assume" OR based on the W7TLT call. Course I've
been know to do crazier things ....Ya Boy. Wonder why no
one on the West Coast didn't pick it up ????
Were they a dog to keep running ???? I must admit I've
never seen one in the flesh or known anyone that had one.
It's already apparently got the shock mount on it
according to Todd so it sounded like it would be cool
to have it mounted in the comm van next to the T-368.
Well so be it ....

Hi Trevor, there was a ham in NY that wanted to see about trucking the thing. I can't deal with trying to ship something that big now. I can't believe no one on the west coast wanted it. I have not had one email about the power supply drawer, I would hate to have to replace the choke or transformer in it. The supply is the same as the T-368. I am going to keep the stuff here until the first of Oct and then it goes to the dumps. A ham in PA took the audio amp the cabinet both the meters a few of the bolts.

Subject: Re: [T-368_BC-610] T-946/GRC-129 for parts

Hi Trevor, there was a ham in NY that wanted to see about trucking the thing. I can't deal with trying to ship something that big now. I can't believe no one on the west coast wanted it. I have not had one email about the power supply drawer, I would hate to have to replace the choke or transformer in it. The supply is the same as the T-368. I am going to keep the stuff here until the first of Oct and then it goes to the dumps. A ham in PA took the audio amp the cabinet both the meters a few of the bolts.

So bottom line .... is it still all together or
have you parted it out ???? I'm a bit unclear if
the Oct deadline is for the remains or the date
to start the parting out. What's the rush ????

Distance + expense to travel makes it a lot less attractive in today's world. Like many of us who sell stuff, Terry no longer wants the item around. If the unit can't be sold intact, at least it can help get or keep others on the air. It's a stripped down version of its AM/CW/RTTY counterpart, so probably not as attractive to most folks. And Oregon is a looooong haul.

I'm in the process of a move right now, and despite still being young enough to move the heavy stuff, the whole mindset for me is evolving. The load is going to be lightened a lot. Keep that hand truck handy. (o:

Well again .... just my thoughts .... but he didn't wait very long.
And it's "HIS STUFF TO DO WITH AS HE WISHES" .... let me be really
clear on that. Even though it sounds like I'm whining I'm not.
I'm just a really cranky annoying opinioned white heterosexual middle
class non-enlightened gun loving God fearing old man and proud of it.
Did I leave anything out .... Hehehe. (Also Heavy Iron and AM loving)

And to tell a story .... Once upon a time .... Or this ain't no S*it.
Back in the day when I did muscle car rebuilding I took 2 years to
complete a 73 455SD T/A. Beautiful car if I don't say so and the
production numbers were somewhere less than 300 such units.
One day as I was out cruising I was stopped by a gentleman that just
had to have that car. We struck up a price and the deal was done.
Two weeks later I was informed that he had been out on the town
one night, had a few too many and wrapped it around a tree.
At first it really pissed me off and then my wife (who is much more
rational than I am) informed me it was no longer mine to say anything
about. She was right of course. Even though what took me 2 years to
complete was gone in a flash it was his car. By the way he walked away
without a scratch. Guess I'll burn in hell but I would have been a
bit happier if he would have at least been busted up a bit .... Hehehe.

Sooooo .... right about now I guess some old Polish Proverb would be
appropriate as Banacek would have done but alas none come to mind.
Todd keep me in mind when you start culling. I don't mind driving.
If I'm really interested in something I'll make the trip for sure.
Fact after all the hurricanes of 2004 and 2005 one of the local dealers
pretty much got destroyed and we bought a new F-250 for cost just
for boatanchor hauling. I believe you're moving to the "Upper South"
so it's not that far from down here along the coast. Even though I'm
older than you I haven't "smarted up" enough to stop dragging heavy
Iron home. Fact just build another building to have more space.

I have for sale a T-368E, complete and in good shape.
Cabinet has some small surface rust, outside only, and
some small white over-spray on the PS section front.

Complete, but it's not been fired up in a good while.
Somewhere I have some type-C jumpers and a pair
of brand new blown-fuse indicator lamps, but can't find
them so far.

Pictures in progress, will post on group.

$750.00 Pick Up Only
Murfreesboro, TN

Would really like it to go in a couple weeks.

Tom NU4G

(note to Joe Foley - a bit better condition than your red-striper, but without the red stripe)

Yes, but does it enjoy tea and scones, OM? I recall well your adventure of retrieving that transmitter, and success despite the best attempts of the Ohio/PA roads to shake it to bits.

Tom, I cross-posted your listing to AMfone as there's a pretty active group there, many of whom appreciate and would love to have a T-3. I'm sure at the price you're asking, it will find a new home quickly. Is this the one that has occupied your living room floor for a while?

Ah,
First off shouldn't be necessary to remove the front panel to drop the pot. R12 removal, first remove the knob, then the nut holding the variable resistor to the panel, push the shaft towards the rear of the transmitter, mark the leads to the resistor as to NOT mix their positions up. Unsolder the leads, drop in the replacement, (you do have a replacement?) resolder leads, poke it back thru the front panel mounting hole. replace the washer, and the nut for the shaft, then the knob. Turn the shaft to the extreme counter clock-wise position. Set the pointer on the knob to the first indicator mark tighten the set-screw. then Check the unit.

If you really want to remove the front panel, and have removed all the screws holding it to the OTHER surfaces. Then just place a large flat blade screw-driver at the top of the front panel and the side bracket pry off the front by working at the three shelf levels, should pop right off.

My first question would be, "Why do you not loosen the four big Allen-head bolts and pull out the Modulator deck with the two handles?"

That would gain access to the offending pot.  I should advise caution to not pull the deck out too far, more than four inches, until you unplug the two cables on the left front.

But I do have a tendency to overstate the obvious, usually in an attempt at humor.

High Folks,

Have an F model and need to replace R12 50 watt wirewound (mod bias

pot) behind the front panel.. Removed all screws, final cap flexible

coupling, and tuning unit band change knob.. The panel still seems

attached firmly.. So the question here obviously is that I may be

missing something OR that 60 years of a snug fit along the edges might

need some "help"..

thoughts?

Thanks for a great group!

Yeah Joe, me and the T-3 are still around...

Both looking long in the tooth these days though... how bout you?

Ott

Hi Group,

Does anyone have a T-368 Oscillator multiplier assy which is complete and would be willing to sell?

Regards,
Jay W7PJS _pjpilot@..._ (mailto:pjpilot@...)

I have an extra one of those that's all there and clean except there's no 6000 tube.

the willingness to sell is the hard part though.

I _know_ I will kick myself someday if I part with it- cause at that point, when I get to the project I am saving it for (which'll be who knows when) they'll be even more scarce and expensive than they already are now

on the other hand, like most of us, I can use extra funds these days, so if someone who was in a cost is no object situation offered me a sufficiently hugely ridiculous amount for it, nearly anything is for sale at the right price (but never my never-issued R-390A)

# 3425. Did you buy my T-368C in Feb 2005?

Yahoo group: T-368_BC-610
Date: 2008-10-07 17:08:35 UTC
From: w5kp
Topic: 3425  Message: 3425

I know, this is an odd post, but I don't have any record of the buyer's name/call, the memory isn't what it used to be, and I have gone through a couple of hard drives and another computer since then, so my email records are long gone.

This transmitter was sold in early February 2005 to a fine gentleman ham from Louisiana. I delivered it to him by meeting him "halfway" in Shreveport, LA, where the two of us (during a major rainstorm) pulled under a car wash canopy and successfully transferred the 700 lb beast to his trailer from my truck without incident or injury.

At the time, the transmitter buyer also expressed interest in my 80' Rohn 45G tower, but I wasn't ready to take it down yet. The tower, with 23' chrome moly mast and all hardware and Phillystran guys, is now on the ground and ready for sale. If the T-368C buyer reads this and is still interested, or if you know him, please contact me off list at my call sign @.... I'm posting this because I promised him first crack when I finally was ready to sell it, and I'm trying to honor that promise.

FWIW, if I don't hear from him in the next few days I'll advertise the tower on TowerTalk and on this reflector, so any others who might be interested please stand by.

73 and many thanks for the bandwidth.

# 3426. HT-4 question from another ham - not on list yet

Yahoo group: T-368_BC-610
Date: 2008-10-10 18:38:20 UTC
From: rbethman
Topic: 3426  Message: 3426

Here is a quick cut and paste - you can respond to him direct at:
<barrie@...>

I see that you are a member of the T-386/BC-610 group. I belonged to
that group several years ago and have recently applied for membership.
However, I've never received approval(?).

I have a Hallicrafters HT-4B, which has not been on the air for several
years, but I'm going to get it on again soon.

I remember the last time I had it on I had a problem with the
push-to-talk circuit. I don't know if it's the switch in the
microphone, or something further down the line.

I posed a query to the boatanchors group regarding the mic connector
that fits the BC-614. I'd like to try another mic to see if the problem
persists, rather than take the connector off the original D-104.

I'm thinking that the folks on the BC-610 list might know where I can
get a connector, but since my membership is in limbo I can't post.

Ok, so I've been dogging it for the last week.

I ok'd two members tonight, that should bring the list up to date.

Be advised that if your e-mail address bounces too many times I will
have no choice but to dump your subscription.

The number of bouncing e-mails depends on the type and version of spam
ware everyone uses, your ISP, your e-mail program, your firewall, etc.
Every time a new version comes out I get a bunch of bounced messages!
Some are easy to deal with, some are a pain in the butt.

# 3428. Connector "TO JB70"

Yahoo group: T-368_BC-610

From: n8zfm
Topic: 3428  Message: 3428

Can anyone tell me what the heck the number is of the mating connector is for the octal jack on the BC-614 that's labeled "TO JB-70"? I have the cable and connectors to attach the 614 to the 610 and they are the same but I need another one for the 614, I have searched high and low and while I know its made by Amphenol I don't know the number and have so far been unable to find one.

If anyone has one that they would be will to sell or trade (I have a bunch of spare 610 parts) please contact me and we can work something out.

Yes actually I do have both the 610, 614 and the SCR-399 manual, it only lists the connector as "SO-101 Connector, receptacle; female 8 rd pol cont; straight; 11/16: lg x 1 1/8 dia o/a; Amphenol", Signal Corps part 2Z3064-123" the signal corps part number does not help me with Amphenol, I am sure its no longer made and I spent a Saturday at the Mendelson's surplus floor searching thru military connectors and could find no mate.

Oh hey, I typed SO-101 and that's wrong, 101 is the Microphone connector and I found that one from Allied. The one I need is the plug that fits connector SO-102 the rest of the description I typed in correctly from the manual - sorry for the typo.
Basically an octal tube base would plug right in and I could use one for a temporary connection but it would not have the threaded shell to secure it in place and I think it would look rather tacky.

Dave,

The two connectors on CD-764 between BC-610 and BC-614 are Amphenol 79-08F1 and 79-08M. I've forgotten which way the gender goes but the F and M mean Female and Male as you would expect. So if it's a female to go to the JB-70, there's the number. $15.00 each NOS plus shipping. I have about half a dozen of each. Sorry for the price (although it's half what plugs for some sets go for) but my source had right inserts in wrong bodies and I had to buy four to make two.

If you don't find some having the number contact me next week. This has been a week of melt-downs and the rest of it isn't going to be any better.

2 KW p.e.p. Linear SSB Class B Amplifier for 80 to 10 Mtrs. in a 1 Cubic Sq. Area for Ham Use. Built from a 1965 ARRL Handbook article it uses a 3-1000Z Grounded Grid Tube that requires 65 watts to drive. Pi output to 50 ohms. Tube not included, has been sold. Was going to modify with a 4-400A which I will include. Meters for 3.5KV HV, 0-1 Amp. Plate Current, 0- 300 mA Grid Current and Relative RF Output. Controls are Band Switching, Tune and Load capacitors. Although I have a 3600 VDC Transformer type HV supply, that I used with the amplifier it is too heavy to ship economically and is not included in the sale. Email me at heavenly@... if you need more Info or pic's

# 3435. HT-4B Problems

Yahoo group: T-368_BC-610
Date: 2008-10-26 20:40:08 UTC
From: Barrie Smith
Topic: 3435  Message: 3435

Hello:

I have not used my HT-4B for several years I've decided to get it back on the air this winter. I attempted to fire it up today, but no luck.

I have AC. I have all the normal driver stage currents. When I apply high voltage I get a dip in plate current, but it dips to about 40 ma.

If I tune off resonence, the plate current climbs to 150 ma and I get a red plate in the 250TH. This indicates to me that I have high voltage, and possibly drive.

Using a receiver in the shack, I get a loud carrier from the driver stages.

The push-to-talk does not work. Usually, in the past, I get a loud relay "clunk" when I hit the push-to-talk. That is now missing.

I checked the switch in the microphone and it's less than one ohm when closed.

The antenna relay does not actuate when I hit the push to talk.

I have idling plate current on the modulator tubes, as indicated by the meter in the transmitter. However, It does not show on the BC-614E meter.

All of this indicates a problem with the cabling between the speech amp, or a relay in the transmitter.

Before I chase my tail all over town, anyone have any ideas?

Barrie,

The chances of finding an actual HT-5 is going to be pretty slim.

The BC-614 speech amps are hard enough to come by, and were produced in
much larger numbers.

Barrie,

The chances of finding an actual HT-5 is going to be pretty slim.

The BC-614 speech amps are hard enough to come by, and were produced in
much larger numbers.

Bob - N0DGN

Bob:

Yes, I know it's a long-shot, but, nothing ventured, nothing gained.

When I tried to fire the HT-4B up again a couple of weeks ago I had problems. Now, I do have a good solid 400 watts out, and the antenna change-over relay is working. But, still no modulation.

I remember that I was having a bit of a problem with the push-to-talk when I last used the transmitter (with the BC-614E). So, I guess I'll just have to keep trouble-shooting and see what happens.

I do have a schematic for the HT-5. There were no provisions for push-to-talk in that unit. And, from what I can glean, The HT-4B didn't have PTP, either

Well, with the BC-614, I did have push-to-talk. So, the Ht-4B must have been modified somewhere along the line for the push-to-talk in the BC-614.

That's what worries me. I don't know what, or where, that modification was or is. Although, it would almost have to be the same pin-out on both the speech amp and the transmitter (?).

Any words of wisdom appreciated!

Barrie,

The PTT for the BC-610 with BC-614 was actually done through the use of the JB-70.

There is a modification using a power supply, rectifier, and relay external to the BC-614 that allows PTT without the JB-70.

The JB-70 was central to connections and control for the generator and the PTT functions.

JB-70s are VERY scarce!

Hence the mod for PTT applied externally to the connector on the right side of the BC-614.

I can send you the schematic for the mod.

I'm not an expert by any means on the HT-4 and -5. I know there were -G
models of both, roughly the same as the BC-610 and BC-614-G. My understanding has
always been that the BC-610-A and BC-614-A were modified HT-4 and HT-5. So
it could be instructive to compare the latter four schematics and see whether
your HT-4 has any of the BC-610-A changes in it.

Bob and Barrie,

The JB-70 didn't come out until the advent of the SCR-399-A and SCR-499-A, with BC-610-E and BC-614-E. The -D models were different from the -E and later and the -A, -B and -C were different from the -D.

Bob:

I was sitting here going over the schematic for the BC-614 (as best I can with my vision) and it appears that the PTT can't work without a jumper on JB-70.

The PTT from the mic goes to pin 4 of JB-70, and nowhere else.

I "think" that the PTT to the transmitter goes to pin 4 on the "to BC-610" socket.

If one were to jumper pins 4 and 6 on JB-70, then there would be a line of continuity for the plate relay (?).

I may, in the past, have had that jumper in place and lost it.

I know that for years I had PTT with this very same BC-614, without modifications.

If you set the BC-614 into its cradle on top of the JB-70, you will be nearly there. But the 12 VDC supply to the JB-70 came from the external battery, so you will have to supply it. There was later a modification of the JB-70 used in AN/GRC-38 that had the DC supply built into the Control. But it isn't in the JB-70.

John,

My understanding of the JB-70 is that it allows "remote" operation of
the BC-610, BC-614, AND the generator.

As has been pointed out by Robert Downs, the JB-70 requires a 12VDC
power source.

I do NOT own a JB-70. Therefore the PTT mod that Lon Cottingham drew up
for PTT. It provides external power AND relay to J1 on the BC-614.

I use this and a Johnson TR Relay for my station.

All:

I do not have the JB-70. When I refered to the JB-70, I meant the socket labeled "JB-70" on the front of the BC-614.

Looking at the schematic for the BC-614, it appears that there are two pins that, if jumpered, would allow the PTT circuit in the BC-614 to key the transmitter. Those pins are 4 and 6.

John, Is this a recently occurring problem?  Has the transmitter been in use recently? I'm in the process of getting my E model back on line after a few years in storage. I found oxidation on several of the tube sockets. I cleaned all contacts in order to avoid any future problem in that department.  Good luck,  Bob  AB8OP

Group,

If anyone ever stumbles across a C-1218/GR, that's the modified JB-70 from AN/GRC-38 (final radio set using BC-610 or T-213) that I alluded to earlier. Lon took the pertinent circuit out of it and drew it up for standalone homebrew purposes. He and I had two or three of the C-1218's between us at one time.

# 3456. Hi Fi Amp for speech amp

Yahoo group: T-368_BC-610
Date: 2008-11-02 21:19:47 UTC
From: Barrie Smith
Topic: 3456  Message: 3456

If I were to forget about the PTT issue, for the moment, I'm still left with no modulation on the HT-4B.

When I was last operating the HT4, at least ten years ago, there was much talk about using a Hi Fi amp to drive the modulator. Since I was getting good signal reports I didn't pay much attention.

Is there a source for the needed information to use such a speech amp? Use an amp with a 500 ohm output? Or, an 8 ohm output with a matching transformer?

73, Barrie, W7ALW

Bob, I have been using the BC 610 on 80 meters for the past year with great results. During the last year it has performed well using a Globe VFO which is stable and does a great job.

During a QSO two weeks ago today, the grid current dropped off on the PA and it has gone down hill from there. I can't determine whether all three OD3 tubes are supposed to ignite, and if so, why the front OD3 doesn't ignite.

I hope to get this beast going again soon. Thanks for the email and all suggestions. 73, John, K5PGW

One of the three 0D3's is separate from the other two. It regulates screen voltage to the oscillator. Most likely culprits are R3 (15K) or the 6V6 is drawing excessive screen current. The other pair regulate the oscillator plate voltage and they share a common source.

Hi Barrie,

I posted a response on the boatanchors list but it will bear repeating here:-

I had a similar problem earlier in the year with my BC-614-E and BC-610-E.

To eliminate the transmitter modulator, I injected an audio signal from a Marconi signal generator straight into the octal socket on the TX back. The sig gen I used had a 600 Ohm balanced output and can give up to 20 volts p-p, not an uncommon spec in older valved sig gens. The '610 came up OK with plenty of mod. The problem turned out to be the output transformer in the BC-614-E; the primary winding, which is centre-tapped, had gone open on both legs. I did have a (used) spare transformer but checking that out showed a similar fault. I asked around for anyone who had a transformer but the only offer I got turned out to be a transformer with the same fault, leading me to suspect this is a weak point in the '614. I eventually located a similar spec, but physically different, RCA transformer on ebay in the audiophile area and that works fine, with just a little metal work to the '614 chassis to make the RCA fit.

I did look at the possibility of using a modern commercial pre-amp/amplifier but wanted to stick with the '614 if possible. I also felt there might be an issue with RF getting into a modern amp, especially as I use an end-fed wire on the '610.

There's been a bit of discussion about the HT-5? The original pre-war HT-5 will be as rare as rocking horse droppings but there was a post-war HT-5 which is just another name for the BC-614-*; the transmitter was advertised as the HT-4, even though it was a BC-614-I in civilian clothes.

Hope this helps,

Roger Basford, G3VKM - Norfolk, England.

# 3461. Meter nuts for meters in BC 610E.

Yahoo group: T-368_BC-610
Date: 2008-11-04 01:08:19 UTC
From: John King
Topic: 3461  Message: 3461

Can anyone tell me if PL11 mounted beneath the meters unplugs from
a socket or not? The PL11 assembly appears to be plugged into a socket, but I see NO GROOVE between the two to enable me to separate them. It is mounted just below the panel meters. I have removed what appears to be a cable and plug assembly with PL11 on the end of the cable. I am not sure whether PL 11 is plugged into a socket or not or if the end of the cable is all one piece. I have removed it from the panel by removing the two screws.

I am trying to remove the exciter deck from the BC-610 E and don't have a schematic for the BC 610 E. I have a schematic for a BC 610 H and BC 610 I and the BC 610 E is PHYSICALLY different from from the H and I models. The schematic I have doesn't show P11 at the end of a group of wires.

Does anyone have hands on experience removing these wires and plugs from a BC 610E?? I only lack removing about three wires attaching to the terminal strip on the exciter deck and the group of wires that go the the PA grid meter and to PL11. Need help to know what to do with the wires attached to PL11. That is all I have left to do before removing the exciter deck. ALL ADVICE ABOUT REMOVING THE CABLE TO PL11 WILL BE APPRECIATED.

I am also looking for some meter post nuts for the panel meters in the BC61E. I have some missing. Does anyone have any defunct panel meters from a BC 610 E that I might salvage some from. This is a VERY FINE thread post and Nut.

All assistance with this BC 610E will be greatly appreciated. Please let me hear from you directly. Thanks and 73, John, K5PGW

It's been 20+ years since I last disassembled an E model and I've more recently been into F and later and can't decide in some cases which memories go to which. But PL11 (8-pin) plugs into SO11, PL1 ( 6-pin)plugs into SO1 and PL2 (6-pin) plugs into SO2. These are all large standard Jones plugs, the type with the flat blade pins and a round alignment pin. You also must disconnect a ground lead to terminal 1 of TS1, the HV lead to the final, the two leads to the filament voltage meter and leads on RY4, the antenna shorting relay. I can't recall exactly which leads from the relay as I can't recall whether the relay in the E was mechanically mounted to the side panel or frame, or to the exciter deck. SO11 is on the upper control panel and SO1 and SO2 are on the modulator deck.

See the schematic I just sent to you.

# 3464. Power Supply for Collins KWM2A and Heath HW-Series Tube Radios Sale

Yahoo group: T-368_BC-610
Date: 2008-11-07 20:33:11 UTC
From: ziolkowskirobert
Topic: 3464  Message: 3464

HV Power supply used with the 100 watt Collins KWM2A and Heath HW-Series Tube Transceivers.
Built with the old Heavy duty Mil. Transformers, chokes and capacitors with solid state rectifiers. Supplied the 750+V, 250V and minus Bias voltages together with filament voltages. Parts alone are worth it. T1 is a 600Vct 150Ma wt. 5V 2A & 6.3Vct 2A winding. Choke 1 is a 6-8H 170Ma and choke 2 is a 15H 150Ma. Has another choke like 1 not connected. Don't know the HV transformer current value but it is 1710Vct putting out 900V no load. A separate 12V Filament Transformer is used for the transceiver. Last used with a KWM2A loaned to a friend. Originally made for my Heath HW-12A & 32A. Can be adapted to any Radio needing those voltages. I can send pictures if you email me your address.

Barrie use the 70 volt line output on a p.a. amp and it will work very well...the only thing you will have to add is a lever switch to activate the xmitteer it is pins 4 to ground on the octal plug on the rear of the 610 the audio might be shielded or twested pair.  It takes very little audio to drive the pair of 2A3's  something less than a watt.....good luck

Hello, T-368, BC-610 Users;

I am the proud owner of Oneida T-368 (F) Number 139. I obtained this unit from Tom Norris-NU4G. From the best I have been able to tell, before Tom a couple of guys in Huntsville owned it. Though I have been looking for a T-368 the last three years, Tom's was the first time I ever laid eyes on a unit..

It is not very pretty but every thing seems to be there. No missing parts, no clipped wires, etc. My plan of attack is to see if I can get every thing working then see if I can make it better looking. I assume that there  are folks who can repaint and letter front panels????

I currently have both blowers out and they sound noisy to me though there is no play in the shaft and no binding. How noisy should they be running outside of the unit? What type bearings are used in these blowers. Permanentlt lubricated?

Glad to be a member of the T-368, Bc-610 group.

Harold

Yes, the bearings are permanently lubed.  It sounds like they are still tight but dry.  You could pry the side plates off and put some grease in there but it's almost as easy to just press on new bearings, they don't cost much and are standard sizes.Joe

Hello!

After coveting them for years, I finally acquired a BC-610-I last weekend. I have it, and many spare tubes and parts stashed safely in my garage. Pictures are here:

http://www.flickr.com/photos/kf6pqt/

Aside from cleaning, checking tubes, fixing the front panel fuse holders and pilot lights, and making up a power cord, (are those connectors hard to find?) what else should I be checking out before I attempt to power this monster up? How heavily rated does my variac need to be?

And yes, I do have a pdf copy of the TM.

Thanks and 73,
Jason kf6pqt

Congrats on the I model.

I would say, the vari-ac would have to -at least- be rated heavy enough
to handle the ratings of the fuses in the front panel.

Figure 100 watts, at idle... (tube filaments, transformer losses, etc)
500w DC input when keyed, and a bit more for modulator bias and audio
peaks... at 120vac, a 15amp variac (at minimum) would be needed, in my
opinion.

The AC line cord connector for the BC-610 no longer appears on NEMA charts. Over the years, I have had some success at finding the older 2-pole turn-lock or twist-lock connectors at garage or yard sales, usually in a box of junk on the ground under their table. However, the L2-20 insert, rated 20A 250V does work. It has one blade wider than the other but from the hard sale finds over the years I discovered that although the holes or slots in the face of the cable females varied, the guts were all the same. The original chassis connector has both blades the same size so the L2-20 will fit both ways.

The only currently available one that I am sure can be made to physically fit is the yellow rubber outer shell one from Woodhead. It requires reducing the OD of the part that fits into the chassis connector shell by about 0.020". However, be prepared for sticker shock at what they sell for. The cheaper white or white and black plastic one I've seen probably has insufficient wall thickness to tolerate the required OD reduction.

Welcome to the Zoo!

I agree the variac should be able to handle the fused ratings.

However, the three, FS1, FS2, and FS3 are rated at 25A, 20A, and 25A.

I do not believe a 15A variac would last long. I have a large Superior Variac that handles 40A.

I can dial the voltage down to the original 110VAC and handle the power throughput. I'd be awfully concerned that a 15A one would burn up.

Congrats on the I model.

I would say, the vari-ac would have to -at least- be rated heavy enough
to handle the ratings of the fuses in the front panel.

Figure 100 watts, at idle... (tube filaments, transformer losses, etc)
500w DC input when keyed, and a bit more for modulator bias and audio
peaks... at 120vac, a 15amp variac (at minimum) would be needed, in my
opinion.

Ok - 22amps. Sounds like a 25ap Vari-Ac will handle it just fine.

Good to hear you on the air this morning, Perry, with that old BC-610-E
of John Mohn/W5MEU's.

ONE DAY, I'll get it back (don't know where the hell I'd put it... but
I'll get it back ;-> )

# 3475. Running on a PE95 genset

Yahoo group: T-368_BC-610
Date: 2008-11-15 16:48:55 UTC
From: Stephen Keith
Topic: 3475  Message: 3475

Has anyone ever run a BC610* on a PE95 genset either on code or phone?
I am asking because in my application (Chevrolet K51 Panel Truck
including BC610 towing K52 trailer with PE95 genset) the BC610 will be
running off of the PE95 in the field.

I am wondering how the PE95 reacts to the load changes, especially with
code having a mechanical regulator and all. Does it "carry through" the
highs and lows of continious code? What about pauses in both code and
speech?

I am still a ways away from finding out myself, but am curious if
anyone else has ever run the original system.

While I can't specifically address this point, my general experience with mechanical regulator type gen sets has been they will keep up with changing loads, within reason. the 610 has to have around  a 200W key up load. Most problems I have experienced have been with motor starting, especially if the genset is being maxxed out by the inrush current.

In most applications, you would want to use a generator capable of 2-3X the normal standing load, or in this case the key down load. Ideally the generator should be running in the middle 1/3 of its load range for best regulation and efficiency. Hopefully this is some help. Definitely check the system under load before hooking up anything you don't want to roast to it

Steve,

I believe the "regulator" you are referring to, may indeed be the governor. Even todays generators have mechanical governors using internal "flyweights" or balls with balance springs to regulate speed of the engine side.

The PE-95 is a 10 KW rating if memory serves correctly. It should have NO problem keeping up with the BC-610 itself. How much of the REST of the systems are you going to use in the panel truck? Receivers, lights, etc?

The 610 should draw about 2KW (and a "tad") when properly loaded. A 20% hit on a generator should be fine, allowing that it "may" have a very brief grunt when first hit with it.

# 3479. more newbie questions, the AC mains supply

Yahoo group: T-368_BC-610
Date: 2008-11-15 18:21:09 UTC
From: kf6pqt
Topic: 3479  Message: 3479

Is there an electrician in the house?

I only have a 15 amp circuit feeding my garage, (where the bc-610 is currently) and the best part of it, its just picked off the porch light of my "front" door. :( This ain't gonna fly.

I rent this place, so there's not a whole lot of major hacking to the electrical that can be done.

The main breaker panel is inside, away from where the line comes in, where the meters are. Crummy little thing, is full. Now, I don't see any 220 circuits hooked up... yet around the corner from the "shack," behind the big old gas stove in the kitchen, is a three-prong 220 plug. If I have three-wire service to the building, that plug is going to be two hot 120's and a neutral, correct? Whats typically the amperage rating for such an outlet? Is it common for these things to not be breakered in an early 1950's building?

Do I have a shot at making anything work here, or does the new monster have to wait until a QTH upgrade occurs?

For those of you who had new circuits run, what did you have put in? (or do yourself?) A 30 Amp 120 circuit?

Thanks and 73,
Jason kf6pqt

Topic: 3479  Message: 3480

Most three-wire 220 volt electric range circuits are 50 amps and should have number 6 wire running to them. I have seen number 8 on some occasions. What also is important is the size of the neutral wire. It should be the same size if you are going to draw sizable current through it, and since most ranges have burners which actually work on 120, the neutral is usually properly sized. But surely your range circuit is fused somewhere. It may be in a separate box away from the regular breakers, having been an add-on circuit. If this circuit is not being used it could be the source of new power for the ham shack. You would still want to have a ground wire in addition to the hot and neutral. A proper size fuse or breaker downstream is important.

From: Alan Morriss
Topic: 3482  Message: 3482

hello guys, regarding power requirements for the bc 610, we have 240v mains over hereso i have to run the scr 399 from an auto transformer.
initially i used a 2.5 kw one used for a link trainer.it is a constant voltage type. it ran things easily, but did get a little warm.
however, i found the voltage was on the high side, so changed over to a 5 kw plant transformer. these were both run from a standard mains power socket using a 13 amp fused plug. the fuse never blew.
our pe 95 was modified for 220 v , so we will have to restore it to original. cheers, alan g4gen

Use the range circuit to feed a sub-panel in the shack.  That could give you two 20 amp circuits.  Use a full sized neutral and a good ground, make sure the old panel is properly grounded, it may not be.

Also, check all the neutral connections as they may have loosened over the years.  The neutral will be carrying ALL of the current from the transmitter instead of it being "balanced" between the two hot lines.

If you don't want to make a big investment in a rented house you could take off the present range receptacle and install a junction box there, then run new wire out to the shack from there.  Fuses, instead of a breaker,  in the range circuit will work fine.

Check to see if your panel has two ground rods, it probably doesn't, you may want to install more.  A cold water line is NOT a good enough ground, no telling what the water line looks like after so many years.

Go through the whole panel and tighten ALL the screw connections, you'll be amazed at what you find.

Joe

The PE-95 was designed to operate an entire AN/GRC 26A.
It will auto compensate for varying loads.
BC-610/ 2 receivers / 3 tty machines / one fsk converter / one fsk modulator / lights/ heater etc etc.
Typically you will hear the generator power up when the xmitter is keyed.

I state this from personal experience as a BC-610 / T 368 repairman stationed in the ASA (division of NSA) in Germany from 1960-1966.

Chuck,

Although your experience is correct (a PE-95-G or later will operate the AN/GRC-26 through AN/GRC-26D plus AN/GRC-38), your blanket statement really isn't. The PE-95-A was originally bought to operate the SCR-299-A, not the AN/GRC-26A which came out almost a generation later. The transmitter in the SCR-299-A is a BC-610-A. It is similar enough to the late model BC-610's or T-213/GRC-26 that you are familiar with that you would probably recognize it as a weird looking BC-610, but you might not recognize the 1-1/2 ton Chevrolet carrying it (at least from your experience in Germany) or anything inside the truck as it is all different from the AN/GRC-26A. For starters, there is no RATT equipment. And the PE-95 used is rated 5KW, not 10.

But anyway, Steve, the 5KW PE-95's will adequately operate the SCR-299. And for that matter, the SCR-399-A Although you probably couldn't run the transmitter and several of the heaters in cold weather. But basically the only significant electrical load in the SCR-299, 399 and 499 is the transmitter, speech amp and one receiver. The 10KW PE-95-G came out in 1943 with the 2KW AN/MRC-1 and 3KW AN/MRC-2. As it cost not much more that the 5KW (basically the same engine and framework) the 10KW model remained the standard medium power generator into the late 50's when progress and politics caught up with it.

It's been some time since we've shared any RF too, Larry! Although, I was on the air tonight, albeit briefly, from the home rig in San Antonio, TX. Worked W0CAB(?) Bob in the Kansas City area, who was sounding great on an ART-5 command set, and he was modulating it with a pair of 2E26's. Sounded GREAT and at one time was roughly 20db/S-9.

Then, worked Lum/K5AYD in Cache, OK with his ever persistent rock-crushing signal from the mighty Apache. I'll ask this here, for Lum - does anyone have any junker Hallicrafter SX-73 version of an R-274 laying around? Specifically, he's looking for the tags that go on the front panel. Frequency chart and the two metal tags below it.

Back to the grind in Houston. The dust is starting to settle down now, after the move.

Thanks for asking, Larry. Life is good ;-)

# 3489. BC-610 for sale in Greensboro,NC

Yahoo group: T-368_BC-610
Date: 2008-11-19 03:43:14 UTC
From: Tom Bridgers
Topic: 3489  Message: 3489

Whoever said, "Too many radios, not enough time" must have been looking at the radios that I have in storage. The time is now for me to realize I'll never get my BC-610 on the air, and so it's for sale.

The is a BC-610-F made by Bogen. Included is a manual, 9 RF final coils, 7 ea tuning units, all tubes, 2 ea replacement HV caps (each 4 mfd @ 4000 volts), 6 ea tuning cards, BC-614 speech amplifier, power plug to 120 VAC, connecting cable from BC-610 to BC-614 (though the cable needs an octal plug at the BC-614 end). All in all this is a nice looking BC-610, and the BC-614 is particularly nice looking.

PA coils included are 2 - 3.5 mHz, 3.5 - 4.5 mHz, 4.5 - 5.7 mHz, 5.7 - 11 mHz,11 - 14 mHz, and 14 - 18 mHz. As is generally true of coils this age, some of the coil holding plastic is crumbling, but using non-conductive epoxy glue usually solves the problem.

Though not clearly shown in the pictures, all tubes are included. You'll see the 250TH and two 100TH's in a box, along with two 2A3's.

Take a look here:

http://picasaweb.google.com/radios4fun/BC610#

What you see in the photo's is what is included, EXCEPT the BC-939 antenna tuner. I'll be selling the BC-939 separately.

The BC-610 is located in a storage unit in Greensboro, NC and the buyer must pick it up from there or make arrangements to have it picked up.

The BC-610 is for sale at $ 800 as is, where is. In other words, FOB Greensboro,NC.

I'd be happy to provide additional pictures or additional info; just let me know what you need. Offers are welcome, please send me an email.

I'm offering it to the T-368 BC-610 group first. If I don't hear from an interested buyer within 5 days, I'll put it on eBay.
Thanks in advance,
-Tom

That reminds me, Tom: I have a black-wrinkle-painted door that goes to a relay rack, and I have this vague memory that it might be a rack that I sold you (or possibly gave you). The door is about 5 feet tall. Do you have the rack still? Do you want the door? If not, I'm going to recycle it... it's seriously in the way! But, you know how I hate to toss stuff out!!

Good luck relocating the '610!

Cheers,
jp

Hello Keith,

I picked up a scrap Hallicrafters-made BC-939-A last year and it has a nameplate on it. It will need the black paint stripping and replacing but I think the lettering would remain legible if the cleaning process wasn't too severe.

It's yours for the cost of postage from UK.

Something else one might try, if they don't have access to a BC-614 (with good transformers in it) is something I did a while back with the BC-610-E that Perry/W5KGZ is running now, and that is to remove the grid leads from the 100TH's, and use another external audio source. In my case, I used a Bogen PA system (that model had (4) 7868's in it, in push-pull parallel) that had been modified with about 20db worth of inverse feed-back added, a regular D-104 and a solid-state audio driver (http://www.qsl.net/wa5bxo/driver1.html). Instead of the usual leads driving the 100TH's, using this- lash-up gave some much better audio quality to the old BC-610. Smooth, clear, clean and hum-free (as long as you were on the xtal, of course).
Of course, wrap up the grid leads to keep them from shorting on the chassis (there's still bias voltage on them) but the mod is as easy to reverse as simply replacing the grid leads on the 100TH's.

# 3498. OT: TS-11-L Handset

Yahoo group: T-368_BC-610
Date: 2008-11-24 10:04:07 UTC
From: g3vkm
Topic: 3498  Message: 3498

Hi All,

Sorry if this somewhat off-topic!

I recently found a TS-11-L handset to go with my BC-669-C. The handset seems to work but has a fairly weak audio level on the earpiece. Is there anyone on the group with a similar handset who could give me typical values for the resistances of the earpiece and mic, think the mic is carbon?

Also, there is some sort of paxolin (?) tubular attachment in-line near to the connecting plug, this is about 5 inches long by about 3/4" round and has a cable clamp at each end, I'm wondering what this is?

# 3499. OT- N.O.S. PE-101-C Dynamotor?

Yahoo group: T-368_BC-610
Date: 2008-11-24 15:27:20 UTC
From: Trevor
Topic: 3499  Message: 3499

Hello all--

long story short, decades ago, when I was a kid and lived near Fort Monmouth Signal Corps HQ, and used to haunt a wondrous nearby radio supply (Atkinson & Smith) I ran across a new old stock PE-101-C Dynamotor.

Had no immediate need for it, but it was so pristine, and modestly priced that it followed me home and has followed me around ever since in a cardboard box. When I got it, it still had the seal wires on it, although as a kid, not knowing it might someday be scarce, I couldn't resist clipping them and looking at the insides. Has connector, which has never been soldered. I ran it once just to see it work.

Ran across the box again today and realized that I have been meaning to ask what system it goes to, and whether anyone is in need of one for a restoration project. Along with the PE-101-C it is also marked Wincharger 41s1 and has inputs at 13/26 V DC and outputs of 400V at t .135 Amp and 800V at .02 amp, plus 9 volts AVT, 80cps at 1.12 amps. It's still nearly spotless other than one ding on the underside that was there when I bought it, and does not really show or affect its function.

I like it enough as an historical ornament that I am not looking to send it away for $0, but if it has some value to someone in a way that would complete a restoration project, and met me a little revenue for some of my own projects, then I would be glad to see it go to a new "keeper" -especially if for someone else, it might be the key to completing a full set up of some family of equipment

# 3500. Meter terminal NUTS for BC 610E meters

Yahoo group: T-368_BC-610
Date: 2008-11-25 18:14:01 UTC
From: John King
Topic: 3500  Message: 3500

I am still looking for meter terminal nuts for my BC 610E. I have checked with fastener suppliers locally and they don't have them and don't know where I can find them. I believe they are 1/4 X 32.

Seems that the best chance of finding these nuts is to find some dead meters for the BC 610E lying around with available nuts for transplant.

If you have a quantity of OLD meters, I would appreciate you checking them to see if any have the 1/4 X 32 threads. The best bet is to find old BC 610E meters or old Hallicrafters meters.

I need several nuts to attach the wires to the terminals of my BC 610E. Your assistance will be greatly appreciated. I stand ready to purchase the old meters or the nuts from them. Thanks and 73, John, K5PGW

You probably already have the answer to this, Harold... but I'd hate to
leave a rock unturned.

> Whoever said, "Too many radios, not enough time" must have been looking at the radios that I have in storage. The time is now for me to realize I'll never get my BC-610 on the air, and so it's for sale.
>
> The is a BC-610-F made by Bogen. Included is a manual, 9 RF final coils, 7 ea tuning units, all tubes, 2 ea replacement HV caps (each 4 mfd @ 4000 volts), 6 ea tuning cards, BC-614 speech amplifier, power plug to 120 VAC, connecting cable from BC-610 to BC-614 (though the cable needs an octal plug at the BC-614 end). All in all this is a nice looking BC-610, and the BC-614 is particularly nice looking.
>
> PA coils included are 2 - 3.5 mHz, 3.5 - 4.5 mHz, 4.5 - 5.7 mHz, 5.7 - 11 mHz,11 - 14 mHz, and 14 - 18 mHz. As is generally true of coils this age, some of the coil holding plastic is crumbling, but using non-conductive epoxy glue usually solves the problem.
>
> Though not clearly shown in the pictures, all tubes are included. You'll see the 250TH and two 100TH's in a box, along with two 2A3's.

From: harold.hairston
Topic: 3513  Message: 3513

Hello, Group;

The plan for my newly acquired T-3 is to determine what needs to be done to get it working, not concerned with cosmetics for now. However, I want to be able to farm-out some or all of the restoration work if need be. I wud like to get it om the air ASAP. Are there individuals who do this? Additionally, Can some one tell me the official T-368 paint color. Many thanks. Harold

# 3514. Looking for Choke L1

Yahoo group: T-368_BC-610
Date: 2008-12-05 02:18:34 UTC
From: John King
Topic: 3514  Message: 3514

The Choke L1 that is located on the exciter chassis of my BC 610E has lost its' "smoke" after the OOZE oozed out!!

The choke is a "reactor" with specs of 6 Henry @ 250 ma, and an impedance of 90 ohms enclosed in a metal case. Later BC 610 models F, G. H, and I have chokes with 2000 vdc rms test or insulation.

I would like to acquire the identical choke, but I may have to replace it with "something similar".

If you have a donor BC 610 with a good L1, please let me know and if it is for sale, I will purchase it.

If you know of a choke that will provide the specs, please let me know. If you will, please help me search for a replacement. The choke that is still in my transmitter measures roughly 3" W X 4.5" L X 4" tall.

My BC 610E is "dead in the water" and I need to find the Choke ASAP.

Your assistance will be greatly appreciated. Thanks and 73, John, K5PGW

# 3515. Choke for BC-610E

Yahoo group: T-368_BC-610
Date: 2008-12-05 04:31:34 UTC
From: John King
Topic: 3515  Message: 3515

I have located a 5 Hy choke at 300ma. and good for 800VDC. which is sufficient insulation for this bias supply in the BC 610E. It is smaller physically than the original and will fit nicely. i will just have to disassemble the BC 610E again and unhook and remove the exciter chassis from the transmitter again which is a pain you know where.

It is new and manufactured by Hammond mfg. which is a good company that makes good components. It is available from a Radio Supply house.

I am glad I found a source and if I haven't received a better lead by tomorrow, I will order this Hammond Choke.

Thanks for reading and looking. 73, John, K5PGW

Actually, I wasn't referring to the code behind it, but to the gross aspects of the user interface. In several areas it, like all others I've looked at for an alternative to CS/AOL, are the same. Two-pane Windows Explorer style display (folder tree in left pane, one and only one folder contents in right), and the usual "none or all" options of what to include from the message you are replying to. The first is inefficient. The second is either aggravating to everyone else on the list, or inefficient (if the sender takes the time as Sam did to avoid the aggravation).

But what was the original BC-939 question? Did someone say they needed a BC-939 cover? I think I still have one, but am not certain whether it came off of a BC-939-A or -B. Not sure that matters, either.

Joe,

The one that's the right color but won't fit could be off of a TMC TAC-1. That's the only thing I can think of that's similar in size to the TN-339/GR and approximately the same color. If the other one that fits is black wrinkle, it's probably off of a BC-939. Or at least I was told by someone looking for a TN-339 cover that in a pinch he could use a BC-939 cover and repaint it. But this is hearsay. Although I have some of all three tuning units, I've never tried to swap covers between them.

I see, the only reason it didn't fit is because the latches didn't line up with the hooks. Yes, the one that does fit is black, but it is smooth black.

OK. The smooth black cover could have gone through overhaul in the 60's. If I recall correctly, one of the T-213's I had was wrinkle (and from the transformers started life as an -F), one was smooth and I can't remember about the third.

# 3528. semi- OT- AN USM 338 O scope manual

Yahoo group: T-368_BC-610
Date: 2008-12-11 00:12:48 UTC
From: Trevor
Topic: 3528  Message: 3528

Hi all- not directly related to my T-3, but may some day help me get some of the quirks out of my T-3 and get it on the air (currently lacking free time as I change out my house's heating system to replace it with a wood gasification boiler)

I have had several oscilliscopes over the years, and at Dayton 07, lucked into a seemingly all-there and working AN USM 338. I think its civlian non-ruggedized sibling is an HP 1707B

all of my prior scopes have been retro in the extreme (Dumont 208B, etc) (wish I still had it, it was a beautiful piece of early electronic design), so, although I get the concepts of a lot of the features on the USM 338 (which are probably retro by standards of things out there new, now), it's too complicated to learn by fiddling and expect to really be making the most effective use of its features

I tried Googling in hopes of finding one on line, but no luck so far. Don't seem to find it on the BAMA either. Any chance anyone can point me to a link for an online copy? If not, is there one available from the wonder-trove of WA5CAB?

thanks & 73
Trevor

OK.  The smooth black cover could have gone through overhaul in the 60's.  If I recall correctly, one of the T-213's I had was wrinkle (and from the transformers started life as an -F), one was smooth and I can't remember about the third.

Yup, exactly, but it IS kind of dangerous to dig in the garbage there, you might get hit in the head by something incoming.

Proper etiquette is to bang on the side of the can or dumpster before tossing.

Not only that but you have to beat Gene and Bruce to the pile.  Bruce is always trying to sell the stuff out of the pile, which isn't bad necessarily, but he SHOULD go retrieve the junque FIRST!!!  Just because someone shows interest in the pile is no reason to dicker a price.

Joe

# 3533. Looking for a TMC TAC-1 Antenna Tuner / Coupler

Yahoo group: T-368_BC-610
Date: 2008-12-11 17:50:11 UTC
From: Gary Geissinger
Topic: 3533  Message: 3533

OMs,

I'm looking for a complete, working TMC TAC-1 Antenna Tuner / Coupler.

Cosmetics don't matter; I'm a user of gear like this and not a collector.

(I can't afford one of these in mint or restored condition anyway.)

73's,

Gary WA0SPM

All,

A DVD is now available covering the 2008 MRCG Field Day event held on Nov, 1. 2008 at
Ft. MacArthur, San Pedro, CA.  Five bucks post paid first class mail -- check, MO, cash PayPal all OK.

The following also available:

MRCG 2008 Meeting, May 2008 at Camp San Luis Obispo, CA (one disk)
MRCG 2007 Meeting (2 DVD set)
MRCG 2007 Meeting (2 DVD Set)
First MRCG Meeting, May 1996 (3 DVD Set)
Massachusetts Museum Ships (one disk)

All $5 per disk post paid.  Discounts for multiple sets (inquire).

# 3535. BC-610I 2A3 Tube Substitution

Yahoo group: T-368_BC-610
Date: 2008-12-12 04:46:02 UTC
From: n8zfm
Topic: 3535  Message: 3535

I need a pair of 2A3's and don't really like the idea of putting Chineese tubes in, and I can't really justify $100+++ each for a pair of real VT-95's so...

Has anyone tried using a 1619 with a base adaptor? I have seen some of the audio type guys using these instead of 45's (That's not a whole lot of endorsement, these guys spend $$$ for special wire that somehow "sounds better" but the specs do look quite similiar, and I would simply connect the 1619 as a triode) the price is still reasonable for a 1619, of course I would rather have a set of 2A3's but I want to use it not put it in a museum.
I was thinking of using an old 4pin base and putting an octal socket on top, that way its a plug in type deal without having to modify my 610 in case I find a pair at a hamfest that the audio guys have not snatched yet.

Good Idea? - Bad Idea? - Another tube better? - Anyone know where a pair of 2A3's can be found without having to spend the kid's college fund?

Heck from the prices I have seen on the bay I could sell my extremely weak pair of 2A3's for their weight in gold and be honest about the test results!

If I have un-intentionally insulted any audiophiles I apologize.

True but its the ending price that's important. Seems that in the last 30sec everyone puts in their actual bid, if you bid a fair price ahead of time you just get out bid at the last second.

Dave,

Well, sure, but you win some, loose some.  Certain  "cult"  favorites go for high prices (single plate versions and certain manufacturers, for ex.) but other 2A3s that will work FB in the 610 are far more reasonable.  I have never had any trouble acquiring all the 801A, VT-4C  and VT-25 triodes (for ex) that I needed by hanging in the game or a while. And who knows, someone here in the group with a dozen extra spares might even cut loose a pair for you.

In any case, good luck!

Go for it! Someone said to connect the suppressor grid to the plate. Connect the screen to the plate through a 100 or 200 ohm resistor. You might post your results. It would be interesting.

Dave I changed the sockets and added a 6.3 volt filament transformer and put in a couple of el34 triodes connected..all the specs are the same with 270 volts on the plate and screen the load imp. is 5000 ohms and they sound real good, as good as the 2A3s or better. They furnish about 14 watts drive for the 100ths more than needed by far so you have plenty of head room. Just a suggestion. I am sorry that I don't have any 2A3s I would be glad to send them to you free. Best of luck

Hi Robert, et. al.,

I have a BC-939A that is missing the cover. I'd like to sell it, and I suppose whoever would buy it might want a cover. If I can't find someone who wants to purchase it, I will be tempted to use the wonderful roller inductors in another project. :-) I think a collector would appreciate this one though, and so I have resisted the temptation so far.

# 3543. HT-4B

Yahoo group: T-368_BC-610
Date: 2008-12-21 20:08:26 UTC
From: Barrie Smith
Topic: 3543  Message: 3543

I'm having some modulation problems with my HT-4B.

On the air reports state that I've got lots of RF, but very weak and distorted audio.

I get no audio at all when using the BC-614, so I'm using a 600 ohm amplifier.

I've not used the transmitter for several years, so an electrolytiic could have gone bad during that time. Although, no one has indicated that I have hum on my signal.

I remember that the modulation meter used to move up and down rather smoothly when I spoke. Now, it is either at idle current, or jumps up very high and quickly.

In an effort to isolate the problem, I'm thinking of coupling the 600 ohm speech amp to the grids of the 100THs. If I get good modulation under those circumstances I'd know the problem is in the 2A3 stage.

My problem is that I don't know what transformer to use, or where to get it.

Any help finding the correct transformer, or any other ideas resulting in a fix greatly appreciated.

I think I'd start by checking the microphone wiring. Look for the
simple things, first.

Since it's been a while since you had the rig on the air, maybe the
contacts on the relay need a little cleaning.
Solder connections become old and cold.

But, if you want to try the outboard audio route, there's an excellent
page on arriving at the best possible solution for driving a pair of
triodes in Class B. Read all about it at
http://www.qsl.net/wa5bxo/driver1.html

Hi Berry you might try putting a transformer grid to grid on the 100th with a secondary imp of 8 ohmes or there abouit and monitor it with a speaker or earfones and see is it is distorted or sounds ok. that would help you isolate the problem..check the bias on the 100th and be sure it is set about 45 ma...there is little or nothing in the 2a3 circuit that wuld cause the problem except for a cathode resistor or bypass to be opening up...you might remove the 2A3 from one socket and measure the resistance from one side of the fil. to ground and see is it reads about 750 ohms.. Lots of luck and please let me know what the outcome of all the suggestions...Ha  God Bless

Subject: [T-368_BC-610] HT-4B

I'm having some modulation problems with my HT-4B.

On the air reports state that I've got lots of RF, but very weak and distorted audio.

I get no audio at all when using the BC-614, so I'm using a 600 ohm amplifier.

I've not used the transmitter for several years, so an electrolytiic could have gone bad during that time. Although, no one has indicated that I have hum on my signal.

I remember that the modulation meter used to move up and down rather smoothly when I spoke. Now, it is either at idle current, or jumps up very high and quickly.

In an effort to isolate the problem, I'm thinking of coupling the 600 ohm speech amp to the grids of the 100THs. If I get good modulation under those circumstances I'd know the problem is in the 2A3 stage.

My problem is that I don't know what transformer to use, or where to get it.

Any help finding the correct transformer, or any other ideas resulting in a fix greatly appreciated.

73, Barrie, W7ALW

Radio Daze in New York ( www.radiodaze.com)  sells the Hammond line. I just bought a Choke for the exciter pwr supply in my BC 610E from them. Also Antique Radio (www.tubesandmore.com)  sells the Hammond line.

It  took Radio Daze about 10 days  to get the choke from Hammond, but it is new and beautiful. I am told that Hammond does great work. 73, John, K5PGW

From: Barrie Smith
Topic: 3543  Message: 3550

Thanks for the continued interest in my problems, but I think I've finally got most, if not all, of the bugs out of my Hallicrafters HT-4B. On-the-air reports, on 75M and 160M, say that the rig sounds very good.

I don't know for sure what I did that fixed things, but I did a lot of contact cleaning. I especially noticed that all the connections to the modulation transformer were loose.

I took all the terminal ends off and noticed that there was a lot of grunge on them. I wire brushed both the terminals and the studs. I also cleaned the 100TH plate cap connectors.

Somewhere along the line, while testing, a couple of hams on 75M, here in the pacific northwest, told me the rig sounded very good.

Now, In order to "guild the lilly", I'm going to install an outboard modulation reactor.

The one I'm going to use is out of a Gates 250GY. According to the Gates manual, that transmitter drew approximately 267 ma of plate current, CCS.

My HT-4B draws, at most, 250 ma of plate current, and that's ICAS. So, I'm thinking that I should be OK as far as current-carrying capacity.

I'm a bit concerned that the resistance is 223 ohms. That seems to be a bit much for a CCS, HV choke.

I plan on Hipotting the choke. The Gates ran 1350 volts on the plate, while I will be running 2000 volts.

What would be a good upper-limit Hipot voltage (my hipot is DC)?

On my inductance meter the choke measures 75 henries. A replacement choke listed in the Peter Dahl catalog is stated to be 65 henries. I think that's closer to correct and may be an "under load" figure.

I plan on using a 4 mfd @ 10,000 volt oil cap in conjunction with the reactor.

Also, the choke terminals are marked "B" on one, and "RF" on the other. Is "B" the "B+" terminal, and "RF" the terminal that would go the the plate of the 250TH?

Same problem with the HT-4B modulation transformer, in that one terminal (on the primary side) is marked "B", and the other is marked "P". "B" is B+? "P" is plate?

Other than watching out for sparks, are there any words of wisdom regarding my grand plan?

From: Gary Geissinger
Topic: 3552  Message: 3552

Gentlemen,

While this isn't a T-368, I bet there are several who can help me with this.  Well, last night a friend brought over an EAC R-390A receiver to my ham shack.  The good news is that the original (ham) owner took immaculate care of the receiver; it must have been in mint condition when he received it.  The bad news is that when the original owner passed away, the receiver got put into someones garage.  It appears that mice lived in it for an extended time, but not recently.

1.  The crystal oscillator deck is probably beyond help; I can get a replacement.
2.  The RF deck was so cramped that the mice couldn't get near the slugs rack; but tube sockets are a mess.
3.  Harness is really a mess.
4.  The bottom deck is perfect.

So I can see several paths here.

1.  Throw it away (my wife really went non-linear over all this...her preference.)
2.  Take a few parts out to clean and keep.
3.  Keep the whole things and take parts out when I need them to repair my other EAC R-390A.
4.  Attempt to restore it as best I can.  (I'm probably going to try this....at least at first.)

There are issues.

1.  Health (Hantavirus and others)
2.  Corrosion
3.  Parts Availability
4.  Cleaning, Lubrication, Stabilizing.

If anyone has some suggestions or suggested references I love a few right now.  Or frankly, what would you do in this case?  I will say that I nearly cried when I took the covers off...really.  It looked so nice...on the outside.

73's,

Gary WA0SPM

It shouldn't be too bad.  You should get on the R-390 mailing list so you can download the updated manual, a LOT of work went into it, complete with pictures, etc.  The manual is worth the download time just for the pictures!

The talent pool is HUGE there and they are very helpful.

I am amazed at the intolerance, and the lack of understanding of the "perfect people" of this reflector.

One unintended click of a mouse with a computer and something highly unintended happens! Then it is too late to undo or call back what was sent.

I know those of you who jumped Perry, W5KGZ's case have NEVER made a mistake and have never before been unkind to anyone, inconsiderate of anyone or clicked a mouse when you should not have. I know you have never uttered a word that you later wished you had not. The AVERAGE human being has not ben so blessed.

Perry is a fine gentlemen who lives about 150 miles from me. He is a BC 610E owner and helps anyone who asks with technical help and parts if he has them. He is one of the kindest, most gentle, older gentlemen that I know.

I don't need to apologize to Perry for anything I said or did, but I do apologize for the rudeness of the "perfect amateurs".

Keep the BC-610s glowing and your kindness showing. 73, John, K5PGW (since 1958 and 20wpm Code)

I echo John's sentiments over the unintended actions of my friend (and I don't use that term loosely) Perry/W5KGZ.

God Bless Perry for having the Passion to care about his country. While being relatively new (relative is a relative term, here) I'm sure Perry's passion compelled him to inform everyone about the atrocities occurring in the White House. He probably merely clicked 'all' in his address book.

While the message was probably misplaced, as showing up in the T-368/BC-610 reflector, it is a good one.

I agree however, that political discussions have no place in a reflector like T-368/BC-610.

Give a good guy a break, would ya? My Friend, Perry Mason/W5KGZ, just celebrated his 86th birthday on the 7th of Jan, and just yesterday underwent a medical procedure. The sheer drama of a doctors visit is enough to scramble the rational thought process in humans half his age.

One correction for John/K5PGW though... Perry not only owns a BC-610E (previously owned by W5OMR, K5LLK(sk), W5MEU(sk) and W5PYT(sk) he also owns two more BC-610s. I *think* there's another E model and an I model, under going restoration in his garage. My next trip to Beaumont (probably within the week) will have me physically helping my friend, Perry, lift and replace the RF deck on one of them, that is very near completion.

Keep dem messages coming, Perry (just be careful where you put 'em) ;-)

I wonder if this post really was a mistake. Haven't we had enough of this crap for the past two years? It's OVER; deal with it. I, along with many others who subscribe to this list would be very grateful if posters would refrain from posting material of a political nature.

One of the oldest tenets of this great hobby is that discussions of a religious and political nature are off limits. Most of us really are not interested in reading this kind of political propaganda on a mail reflector devoted to vintage military transmitters.

# 3571. 600 ohm Line to PP 100TH Xformer

Yahoo group: T-368_BC-610
Date: 2009-01-25 00:42:50 UTC
From: Barrie Smith
Topic: 3571  Message: 3571

Hello:

I've pretty much determined (with lots of help) that the CG-512 transformer will work properly as an outboard 600 ohm line to the PP 100THs grids in my HT-4B.

I've read somewhere that, in order to easily apply bias for the modulator tubes, I can attach a jumper from one of the existing grid lines to the center tap of the outboard transformer.

With this arrangement, I will still be able to adjust the bias from the front panel.

An I headed down the right road? Any thoughts?

That might work but it would be far better to attach the jumper to the centertap of the existing grid transformer. That way, you avoid adding the resistance of the secondary in series with the bias supply.

# 3573. T-368 Problem to be solved

Yahoo group: T-368_BC-610
Date: 2009-01-25 03:04:22 UTC
From: Rodger Hough
Topic: 3573  Message: 3573

T-368 Series F Troubles

I?m having some troubles with my T-3, TRW Serial #400.
Two other T-3 owners, Mark KA4JVY and Maury NRGUI and I initially brought the recently acquired T-3 up on a Variac and in stock form, the T-3 performed normally over an hours period into a ME-165 dummy load using a stock carbon microphone.

I then proceeded to modify the transmitter using mods widely found on the web with notation to Timtron, W3NP, KK4DF and others. The mods are detailed below.

Upon completion of all mods, the transmitter tuned and loaded properly in both CW and AM push to talk mode. Tuning and loading at somewhat different numerical points attributed to different plate choke. Plenty of RF output; plenty of modulation.

NOW THE PROBLEM.

The T-3 will go INTO transmit with little difficulty. It?s the UNKEYING that causes high voltage arcs usually at the safety interlock HV feed point. Sometimes the arcing can be noticed at both the RF and Modulator HV feed points. Most times you must reset the plate relay.
On ocassion the Plate Circuit breaker will trip. And recently while trying to find the problem, the transmitter plate relay stuck on and the only way to get out of transmit was to power down completely. Whacking K6, the plate relay, would then release the circuit.

Any help resolving the problem is greatly appreciated. I?d love to get this baby on the air.

Thanks,
K1HH
Rodger

DETAILS OF MODS

Modifications include isolating the final tank circuit by paralling two 470pf/16kv doorknob caps, winding a new plate choke to feed the final (260 turns 24 guage wire on 3/4 inch pvc form) In addition coil L13 (pi choke) was moved to the top of the deck and high volage bypasses of 470pf/16kv are on the top side of both L13 and the new plate choke. The Sagamo tub (former blocking cap) has been strapped across and former leaking brown brick C10 bypass capacitor has been removed. The original L3 plate choke?s bottom end (original B Plus feed) now goes to ground. In addition the plate meter was made a

cathode meter and bypassed with two back to back diodes and a cap.

Mods to the audio deck follow those detailed by Timtron,
W2ILA, KG2IC, W1UJR and others. They include bypassing the filters
and clipping circuit in the speech amp and changing a couple of caps
and adding a bypass or two.
The carbon mic bias voltage was removed from the front panel mic
connector so that an amplified D-104 can be used.

I?ve checked my wiring and believe it to be correct. Pix available of
my choke/ bypass cap arrangement, but follows those who have ventured
here before.

Any ideas out there in T-3 land?

Respectfully submitted to the knowledable Amateur Radio Fraternity.

K1HH

Sorry, but I'm not sure I understand that, nor how to do it.

I was under the impression that the bias voltage would appear on each grid connection line. If I connect one grid connector line to the center of the outboard transformer I should get bias to each 100TH.

Could you be more specific as to where I'm going wrong here?

I've said this before, here...

I had a 'solid-state Class B Audio driver', that was used to drive the grids of a pair of 250TH's in Class B.
(Google for 'solid-state audio driver wa5bxo)

Basically, it's a pair of vertical output transistors, that take a lot of voltage on the collectors, and have a very high beta. They are lashed up in an emitter-follower configuration. The emitter output lines, directly drive the grids of the Class B modulator tubes.

The audio path comes from the plates of a push-pull audio amplifier. The audio is fed through a pair of DC blocking capacitors, then to the hi-Z side of some output transformer (think; typical push-pull 6AQ5 output transformer), that has a center tap.

In my case, I used an old Bogen PA system. Grounded the driver (built into it's own chassis) to the '610, fed the emitter output lines to the grids of the 100TH's, and received 'glowing' audio reports. The driver has it's own built-in adjustable bias supply. As originally built, it had the ability to swing 585Vp-p. More than enough, for 250TH's in Class B.

The 'mod' as to remove the grid clips to from the 2A3 audio driver in the '610, and replace them with the solid-state driver output leads. In order to restore the 'mod', remove the solid-state driver leads, and re-clip the original grid clips.

If googling is difficult to do, go to
http://www.qsl.net/wa5bxo/driver1.html for details.

Yes, the bias voltage will appear on each of the original grid leads from the existing driver transformer. But as with the outboard transformer you have, the secondary has resistance because of the copper wire the secondary is made with. This resistance will be added in series between the output of the bias supply and the centertap of the outboard transformer. It may not hurt much to have it there but there's no way in which it can help anything.

To avoid that, connect to the centertap of the existing driver transformer secondary. Not one of the grid leads.

Ok,
I'm confused! Have you read the manual for the HT-4? Next I would
ask what the purpose of the outboard transformer is.

Also just for informational purposes, the HT-4/BC-610(E) has a 500/600
ohm input already. Also the bias for the 100THs comes from the HT-4
and BC-610(E) 5Z3 and a single adjustment from that supply sets
the bias level to the 250TH.

What was the original question, and aim?

Agreed, that the '610 already -has- a 600-ohm line input stage, with the
BC-614 speech-amp and control box. The audio output from the '614 has
600-ohm line out to drive the 2A3's.

I'm not in agreement with this method. To control the amount of grid bias on the 100TH's, there should be a controllable negative voltage applied to the center-tap of the driver transformer.

Subject: Re: [T-368_BC-610] 600 ohm Line to PP 100TH Xformer

Ok,
I'm confused! Have you read the manual for the HT-4?

Yes, many times. I used this transmitter for at least 8 years prior to 1997. I became quite ill in 1997, so I didn't use the rig again until just recently.

When it was shut down, it was working just great, with FB signal reports.

Recently, I fired it back up. I got no RF out, which was easily repaired. However, I got reports of terrible audio and low modulation.

Sparing everyone the details, I now am getting reports of "okay" or "fair" audio.

I think that the problem is in the 2A3 driver stage. So, I thought I'd install a "temporary" outboard transformer just to see if the audio improves.

If the audio does improve, then I know work is needed in the 2A3 stage. If it doesn't improve, then I need to look elswhere.

Next I would
ask what the purpose of the outboard transformer is.

Also just for informational purposes, the HT-4/BC-610(E) has a 500/600
ohm input already. Also the bias for the 100THs comes from the HT-4
and BC-610(E) 5Z3 and a single adjustment from that supply sets
the bias level to the 250TH.

On my HT-4B, the bias control sets the bias level for the 100THs only

What was the original question, and aim?

See above and below.

Have you checked through the "FILES" section of the homepage for this list yet?

There are some ideas there, too.

Check the HV wiring under the plate transformer for cracking, also check the spark gaps on the HV caps on the power supply deck for proper spacing.

Check that the HV contact shoe from the RF deck to the antenna is firm and even across the whole contact area.

Just guessin'

Joe

Check the Clamp Tube, that is the straight sided 805, can't remember the number, and I am not at home around the manual. My T368 C, by Crosley, experienced the same problem. I checked the tube in a tube tester, TV 7D, and it checked good. I subbed it, and the problem went away, never to return.

Might be worth a try.

Joe:

Thanks for the suggestion. I'll see if I have a spare, and if not, I should have.

I had a similar problem with my T-3.? I traced it down to an arc inside the output inductor between the winding and a mounting bolt.? It would only arc with unkeying and then other arcs, etc would appear.? Solved it with a cleaning and a nylon bolt.

Have you checked through the "FILES" section of the homepage for this list yet?

There are some ideas there, too.

Check the HV wiring under the plate transformer for cracking, also check the spark gaps on the HV caps on the power supply deck for proper spacing.

Check that the HV contact shoe from the RF deck to the antenna is firm and even across the whole contact area.

Just guessin'

Joe

Sorry, but I don't quite understand the question...
I thought this list is named T-368 and BC-610. and as such it is for
the discussion of the T-368 issues (as well as BC-610 issues). I there
anything someone may want to hide from BC-610 people (LOL) so a
completely separate T-368 list is sought?

no the question was not to hide from bc610 owners i was just wondering if this is the right place for discussion. i currently own two bc610's and one T3 so i have all kinds of issues i am currently dealing with a issue in the T3 with a little arc going on some where in the mod deck which i have not found as of yet but if i kill the mod deck the arc will go away in the past i found the arcing to be the innerlocks, if one of the innerlocks does not seat properly it will pass too much current and weaken the spring in the innerlock which will cause some arcing, most of the innerlocks can be bypassed anyway i have found them to just be a source of trouble. i have done some mods which i will chime in on later, the T3 discussion is a passion of mine this is my favorite radio of all the ones i own and i have lost count of how many xmitters i have. i will be reading group responses some one might can help me with my issues.

# 3592. Re: [T-368_BC-610] T-368 Problem to be solved

Yahoo group: T-368_BC-610
Date: 2009-01-28 03:10:26 UTC
From: Joe Foley
Topic: 3573  Message: 3592

Well,.....

This did start out to be for the T-368/URT but since the BC-610 and the HT-4 are the predecessors of the T-368/URT I included them in the discussion, too.

And since there are 200 people on this list that appreciate this stuff I am baffled as to why you'd want to exclude any of them, especially since they all have so much to offer.

The goal, of course, is to own one of each!  But since the HT-4's are so rare that just isn't possible for each of us.  We'll just have to live vicariously through the others.

I had a similar problem with my T-3.  I traced it down to an arc inside the

output inductor between the winding and a mounting bolt.  It would only arc

with unkeying and then other arcs, etc would appear.  Solved it with a cleaning

and a nylon bolt.

73's,

Have you checked through the "FILES" section of the homepage for this

list yet?

There are some ideas there, too.

Check the HV wiring under the plate transformer for cracking, also check the

spark gaps on the HV caps on the power supply deck for proper spacing.

Check that the HV contact shoe from the RF deck to the antenna is firm and even

across the whole contact area.

Just guessin'

Yup, that nylon bolt is supposed to be in there. Clean the china and polish the silver, check for cracks, clean, clean, clean.

I'll buy that, it has to fit into that shield thing.

I've found them at the Rochester Hamfest for cheap, must be they don't get used for much else.

The "shield thing" prevents the insertion of a regular 807.  Believe this is it's purpose although can find no documentation to that effect.  High voltages can appear at the screen of the 4-400 during operation and hence at the plate and screen of the 5933/807W clamp tube.  The button base construction of the 5933/807W is probably less prone to high voltage flash over than an ordinary 807 although, again, I've never seen any data on this.

I've found them at the Rochester Hamfest for cheap, must be they don't get used for much else.
Used in applications where the smaller size is a consideration.  Also, probably more shock and vibration resistant.

# 3602. One BC 610 E MYSTERY WIRE needs a home

Yahoo group: T-368_BC-610
Date: 2009-02-08 19:10:11 UTC
From: John King
Topic: 3602  Message: 3602

Thanks to Sam Cook, I have all of the "dangling wires", EXCEPT ONE, connected to "something". Hopefully they are where they belong, correct wire on the correct terminal strip and terminal.

HOWEVER I have one wire without a HOME. It is a RED wire that runs from the front of the BC 610 E panel to terminal strip area and is laced to a black wire that I have put on TS1 Terminal 1 which is chassis ground. There are two black wires on terminal 1 of TS1 now. QUESTION IS, where does, what appears to be a RED wire, connect? I have run an ohmmeter continuity check between every pin on PL 1 and PL 11 and the RED wire. So the question is where does the Red wire that doesn't come from either plug connect?

I am so close to the smoke test, but just can't quite make that last connection.

Hi,

I am new on this group having acquired a civilian HT-4. Please put up with my questions from time to time.

Are there any members here who have the civilian HT-4? If there are any, I need to connect with you advice.

How many were produced and what years were they produced?

How many are left in private collections?

I uploaded some photos if anyone is interested.

Thanks in advance.

Subject: [T-368_BC-610] HT-4 Questions

Hi,

I am new on this group having acquired a civilian HT-4. Please put up
with my questions from time to time.

Is an HT-4, or an HT-4B, or what?

Are there any members here who have the civilian HT-4? If there are
any, I need to connect with you advice.

I have a very nice and unmodified HT-4B.

How many were produced and what years were they produced?

I'm not expert in such matters. I've been told that very few were made and sold for civilian use. They were very expensive for that time period. I've been told that mine was probably made in 1938.

How many are left in private collections?

I can't answer that question. You are the second person that I know of that has one. There must be others, but I don't know where.

73, Barrie, W7ALW, Since 1950

I uploaded some photos if anyone is interested.

Thanks in advance.

Greg Farrell
Santa Rosa, California

Hi Greg,

See you found us OK!

That's a real find, and your photos show some detail I've not seen before. Someone was posting a couple of weeks ago about some problems on his HT-4, so there's at least one other owner here. I do have an original manual for the HT-4B/HT-5B and AT-2 if you need any info.

I believe the HT-4 was first made in 1938, October 38 it appeared in QST. After WWII, Hallicrafters released a bunch of BC-610-H models designated the HT4-H onto the ham/commercial market.

It might be worth you downloading the wartime film "Voice of Victory" as it shows the HT-4 being converted into the BC-610 for war service. Good close-ups too of '610s being built.

Hope this helps,

Roger/G3VKM

Norfolk, England (BC-610-E owner).

Barrie,

> Is an HT-4, or an HT-4B, or what?

I don't actually have the unit in my home yet. I pick it up early next month. I just sent the seller an email to clarify but supposedly it is an HT-4 (A?). I asked for the serial number also.

You can see the photos of it in the photo section here.

> I have a very nice and unmodified HT-4B.

Good to know you!

> I'm not expert in such matters. I've been told that very few were made and sold for civilian use. They were very expensive for that time period. I've been told that mine was probably made in 1938.

Good thing they got the military contract. At $795, you're right, very few could afford such a unit. I think the average wage was around $5-$10/day back then.

> How many are left in private collections?
> I can't answer that question. You are the second person that I know

Interesting statistic.

> 73, Barrie, W7ALW, Since 1950

I hope to attain my license and call sign sometime this year. In the meantime, I cannot use the transmitter but it will take me some time to get a proper power system engineered into it and the antenna that will work in my hilly area.

Do you have any recommendations for a dummy load antenna I can use to test it?

Thanks again,

Greg Farrell

hello guys, hearing about the ht4, are the 10 and 15 metre coils and tuning units possible to get ? it would be nice to run the 610 on these bands if they would fit.
also, it looks as if the smoothing choke for the exciter ht has gone in mine.there is no continuity between the rectifier cathode and the 807 plates or the meter.
i hope it is something else, and will find out when i get the rf deck off. what choke designation made by hammonds will fit ? otherwise i will have to get it rewound. also, does anyone have the brackets from the top of a bc 342/312 ? cheers, alan g4gen

Thanks for the offer! Luckily, the seller had the manuals and has
mailed them to me in advance of picking it up next month.

> I believe the HT-4 was first made in 1938, October 38 it appeared in
> QST. After WWII, Hallicrafters released a bunch of BC-610-H models

That explains the cabinet styling on the HT-5B. Looks just like my SX-16.

> It might be worth you downloading the wartime film "Voice of
Victory" as it shows the HT-4 being converted into the BC-610 for war
service. Good close-ups too of '610s being built.

Yes, I have seen that video when someone posted about it on the other
board. It actually is what led me to finding this one. I wasn't
actually shopping for one, but I mentioned it when visiting a
colleagure who has quite a collection and asked him if he had an HT-4.
He said he didn't but his friend did. Then he emailed me a couple of
days later that his friend was thinking about selling his and was I
interested. Well, heck yes!

> Hope this helps,

Thanks! It sure does.

Alan,

Sorry to hear you've had problems. Can you send me the part number or a photo of the choke that's down? If you remember I got several chokes and transformers from you with the '610-E.

Hi Greg,

OK, well make sure you have plenty of strong pals around to help you lift that HT-4 when it arrives!

For basic testing, I used a 200 watt light bulb for a dummy load, just connected across the antenna terminals as they do in the VoV film. Since then I've acquired a commercial blower-cooled model that handles >300W at 75 Ohms, but the '610 drives that off-scale on full power so I have stuck a Palstar 300w/3kW SWR/power meter in-line.

Alan,

<Grimace>, Yes, the BC-610 "can" be made to run on 10 mtrs. HOWEVER, that being tossed out there, there is a REAL reason that Uncle Sam did NOT include the coils and TUs for 10 mtrs. Converting the Beast to run 10 mtrs is a NIGHTMARE in actual use!

The Beast ends up crawling with RF! And it does NOT matter how well it is grounded!

Jim, WB2FCN, can give you more information.

I don't recall what it was that you originally disconnected wires in order to
do. PL1 and PL2 go to TS1. PL11 goes to TS2. But try checking continuity
between the red wire and the modulator plate current meter. It that's it, pull
the black wire you put on TS1-1 and make sure that it isn't the other one.

Date: 2009-02-09 01:22:44 UTC
From: John King
Topic: 3602 Message: 3619

Robert, thanks for the email. I originally lost excitation and recapped the exciter section and replaced almost all resistors. I put it back together and it worked for about 15 minutes and the the 6 hy choke in the low voltage (exciter) power supply shorted and I replaced it with a NEW 5 hy.@ 300ma. choke from Hammond of Canada. I had to remove the RF deck to do that and I had to remove the leads from TB1 and TB2. I am not sure that I got all the leads back where they belong.

I just checked TB1 and TB2 and found that the leads from Pl 1 and PL 2 are on TB1.

I also found that the leads from PL 11 are on TB2.

Somehow there must be a lead in the wrong place and on the incorrect terminal.

I checked with WD5BZO and he stated that the Reddish/Brown wire is on terminal 2 of TB1 in his BC 610 D. I put that lead on TB1 #2 and it made no difference. I have two black leads on terminal 1 of TB1.

It was my impression that there is not supposed to be a lead on TB1 #2!!

Something is wrong. I have very good current on Doubler plate and IPA, but the tuning controls on the tuning unit for tuning of the Doubler plate and Intermediate Amp (807s) have no effect when tuned as far as dipping and peaking per the instructions are concerned. In fact, when the controls on the tuning unit are turned, the current pegs the meter and the #47 bulb in the tuning window gets VERY BRIGHT. VERY LOW GRID CURRENT on the 250 TH.. It looks as if the oscilator, doubler or Intermediate amplifier is taking off.

I made some measurements between the RED/Brown wire and ground with my Fluke and read -8 to -14 volts to ground. With filaments off and OHMs meeasured from Red/Brown wire to ground and exciter plate switch off there is no resistance reading, but when I turn on the exciter plate switch with no power connected, the ohm meter reads some resistance but counts down to very low resistance as if the ohmeter is reading across a Power supply with capacitors.

I am really at a loss about what is wrong. Good current, but goofy symptoms. 73, John K5PGW

Roger

Do you not run it up to full power output spec?

Also, what is the white box off your antenna leads?

And what is your AC line input power running at? Do you run it through
a step-down transformer?

Thanks,

Greg Farrell

Greg:

If it's a straight HT-4, then it's going to be a bit different than the later models, which shared more with the BC-610.

I have the manual for the HT-4. There are several differences between that transmitter and my HT-4B.

I'll dig that manual out and attempt to let you know what the differences are. In any case, you will need the manual for the HT-4, not the BC-610 (althought there are many similarities).

From what few photos I've seen of the HT-4*, I don't believe that the knobs on your filament and modulation bias adjust are the correct ones.

The HT-4* used the "steering wheel" knob on the final tune, but the knobs on the filament and modulator bias are much smaller. Not that it matters. It wouldn't bother me a bit.

When I first fired my rig up, I used a 100 foot extension cord with a 150 watt light bulb in series. I'm glad I did, since the bulb lit to full brilliance, and one of the modulator tubes did the same.

After I got things tamed, I used a 500 watt flood lamp as a dummy load. Actually made a one-way contact, with a friend, several miles away, listening to me, with the light bulb.

Some other things to consider would be: Are you getting a full compliment of tubes with the transmitter? The 250TH final, and the 100TH modulators are getting a bit scarce and more

than a bit pricey.

What about tuning units and final coils? You will need a TU and final coil for every band.

Also, and I've asked this question in the past, with no response, does your HT-4 have four ceramic pillars, with banana sockets, on a shelf, in the left-rear of the RF compartment?

My transmitter does. I have been told that this was a socket for a fixed air-capacitor for operation on the lower bands.

I have the socket. I do not have the cpacitor. I use a vacuum capacitor for operation on 160M. I have a 1.5 to 2.0 tank coil that I can use for 160M, without the vacuum cap, but it has a two-turn, fixed link. I can't load up to more than about 250 watts output with that coil.

I use the 2.0 to 3.5 coil, with a 50 pf vacuum cap, for 160. I can easily load to 400 watts output with that arrangement.

There's an HT-4 here in Houston. A friend in NJ had an HT-4-G a few years back but I'm not certain that he still has it.

# 3626. More on the HT-4 - BC-610 Story

Yahoo group: T-368_BC-610
Date: 2009-02-09 06:58:45 UTC
From: Greg Farrell
Topic: 3626 Message: 3626

Digging around the internet, hard to find much on the HT-4 which evolved to the BC-610. What a rich history and tribute to both transmitter designs, though, found in this US Army history website.

http://www.gordon.army.mil/ocos/ac/WWII/SCR299.asp

by Ted Wise

The Signal Corps' SCR-299 is the best example of Yankee ingenuity before U.S. entry into World War II. The 299 was the civilian and military communications experts' effort to give a long-range communication advantage to the U.S. Army and its allies.

Military observers were unanimous that the success of modern, fast-moving "blitz" tactics was directly linked to how efficient armies' communications systems were. Up to 1940, communications by messenger, signal flags, telephone and other signal devices had been adequate to meet the challenge of the slower-moving military machinery.

However, Germany's initial successes in a highly mechanized form of warfare were attributed to their efficient and highly reliable communications system ☐ the lightning-like movements of their panzer divisions could be coordinated and timed for split-second action. These tactics produced an ever-changing battle line ranging over distances of many hundreds of miles.

Communications officers could see that if the United States became involved in the war, our army also would have to be equipped with modern communications to coordinate our combined ground, air, sea and armored forces ☐ none could function efficiently without the others' aid.

To meet these demands, a high-powered radio transmitter was required ☐ capable of infallible voice communications over 100 miles; self-powered; sturdy enough to work in all conditions (cold North, hot South, jungle humidity or dry desert heat); flexible enough to cover a wide range of frequencies; and able to operate in motion or at fixed locations. It had to be entirely independent in its mobility-containing repair and replacement parts to ensure its continued operation on detached missions.
"Olmstead's Baby"

The problem to find, procure, test and field such a unit under all conditions ☐ and produce it in time to give our army what it needed ☐was the concern of Col. Roger Colton, chief of engineering and technical services at Fort Monmouth, N.J.

"Olmstead's Baby," as the project was called (after the Chief Signal Officer at the time), was to find commercial and military parts already produced and make them work together. Colton's program gathered commercially built transmitters with the necessary requirements for Signal Corps adaptation. Out of the various sets sent from U.S. vendors, and after considerable experimentation, Hallicrafters' Standard HT-4 transmitter was chosen as the desired radio's basis.

Production began in early spring 1942. The HT-4 ☐ designed for amateur use and commercially available for several years ☐ was compact and stable. It could deliver 325 watts of power on voice and 450 watts on code. It was crystal-controlled but provided optimal use of the master-oscillator power amplifier and was able to work over a wide range of frequencies.

The Signal Corps' requested changes were achieved by Hallicrafters' engineers working with Army technicians at Fort Monmouth. Adapting the transmitter to military use required incorporating minor changes, augmenting the basic unit with more electronic devices ☐ permitting the transmitter to handle a wider range of frequencies ☐ and standardizing control equipment.
Toughening the equipment

The engineers and techs strengthened the steel cabinets and shock-proofed individual units so they could withstand the terrific pounding they'd encounter in military vehicles. Cables, connectors and plugs were designed specially to permit the extreme flexibility of operations in motion.

Also, some component parts had to be treated specially to prevent the corrosion likely in some climates.

Other minor changes included adding several relays to permit automatic changeover of military- operations circuits. The engineers designed an overload relay system that proved to be completely chatter- proof. An ordinary relay would kick out when traveling over rough terrain; reset controls were placed on the unit's front panel and made readily accessible to operators.
Other improvements

A master oscillator was also designed which provided continuous coverage without a maze of crystals ground to the many frequencies required for military communications. A switch on the tuning unit controlled the changeover from crystal to master oscillator.

The antenna problem was met after much experimentation by designing a vertical whip some 35 feet long. To match the antenna to the transmitter's wide frequency ranges, a special antenna coupler was designed to allow accurate loading at any frequency the transmitter covered. Commercial engineers devised a continuously variable network which, when connected to the vertical, provided the necessary matching required.

The SCR-299's variety of replacement parts were packed uniformly and standardized for easy location.

After mechanical considerations were met and a layout adopted for the various units, the Signal Corps techs turned their attention to designing a suitable truck. A 1 1/2-ton capacity truck would be required, with a dual operation system for the two operators on duty at all times. Either of the operators would have complete control of receiving and transmitting equipment.

Also, another unit (trailer) was required to transport the gasoline generator that powered the transmitter, receivers and communications-truck lighting. The two units had to be separated so mechanical vibration as well as the generator's noise wouldn't interfere with communications.

Field telephones with plenty of cable were carried in each unit. They were used either as interphones or to control and modulate the transmitter from a remote point.
Vital links

The HT-4 transmitter's new version became known as the BC-610 transmitter. The receivers finally supplied were the BC-312 and BC-342, plus the BC-614 (speech amplifier), BC-729 (tuning unit) and BC-211 (frequency meter), along with the PE-95 (power unit). All these became part of the truck-and- trailer unit called the SCR-299 ☐ later better known as the "mobile communications unit."

The SCR-299 was part of the first equipment to land on the African shores and did yeoman duty during those hectic days when the fate of the United Nations' African campaign was in the balance. For long periods it was the only means of communication linking Oran and England, Oran and Casablanca, Gibraltar, Algiers and Accra.

By this time our allies had heard of this famous equipment that gave such phenomenal results and, through Lend-Lease, gained many complete units. British generals Montgomery and Alexander used the SCR-299 to coordinate their successful efforts against the Germans in North Africa.

Gen. Dwight Eisenhower credited the SCR-299 in his successful reorganization of the American forces and final defeat of the Nazis at Kasserine Pass. In the invasion of Sicily and later Italy, the SCR-299 was used with telling results.

Though the original Signal Corps requirements were for communication points up to 100 miles, under favorable conditions these transmitters made and maintained contact over 2,300 miles of land and sea.

Without adequate communications, the Army's numerous divisions couldn't have been used to their fullest. World War II proved communications and split-second timing were crucial in overpowering Germany's panzer units. The SCR-299 provided the necessary answer to the Blitz.

Mr. Wise, curator of the Signal Corps' museum at Fort Gordon, Ga., has a bachelor's degree in graphic art/art history from Cameron University and a graduate degree in museum studies from University of South Carolina.

Interesting (I've read it before), but there are a few errors. First, the Signal Corps at Fort Monmouth employed engineers, too (my Elmer, W5MO, was one). Not just technicians. And Hallicrafters employed technichians, not just engineers. The antenna used while in motion was the standard 15 foot whip, not a 35 foot vertical. Can you imagine driving around with a 35 foot tall antenna? Third, the BC-614-A was adapted from the HT-5 as the BC-610-A was adapted from the HT-4. The BC-729 was purpose built for the SCR-299-A (and later replaced by the BC-939-A) but the rest of the major components except maybe the 1-1/2 ton Chevrolet Van were already in service and simply incorporated. Fourth, the frequency meter was the SCR-211 (major component the BC-221), not the BC-211.

Hi Greg,

That box was a Heathkit B-1U balun that I experimented with to feed my doublet antenna. It wasn't rated at full power so I built my own replica of the AT-2, which works OK.

The domestic supply voltage in the UK is 230 V at 50hz so I use a "site transformer" (the yellow thing to the right of the '610) to step the voltage down for American gear. The site transformer only gives 110V, (it's designed to power electric tools like drills outdoors) so the '610 tends to run a little low on output, plus the antenna relay buzzes like mad due to being designed for 60Hz!

We in the UK have lower output power limits than the US, 400 watts PEP max, so the '610 is fine on CW but you have to keep it throttled-back for AM :-))

Reference the use of the HT-4 and BC-610 on the higher HF bands, the best I've managed is 18MHz.

Alan,

<Grimace>, Yes, the BC-610 "can" be made to run on 10 mtrs. HOWEVER, that being tossed out there, there is a REAL reason that Uncle Sam did NOT include the coils and TUs for 10 mtrs. Converting the Beast to run 10 mtrs is a NIGHTMARE in actual use!

The Beast ends up crawling with RF! And it does NOT matter how well it is grounded!

Jim, WB2FCN, can give you more information.

hello again. i use the same transformer as roger. i did use one which had been powering a link trainer, but the voltage was around 120, so i went over to the plant one. my only trouble with it is that the truck is live to earth through the t/r relay, as when i ground it, the relay goes over . i ground it through a large capacitor.
all works well that way. we carry the transformer inside for military vehicle shows when we are using a commercial generator to power it. the pe 95 is next on the list for restoration, but at some time it was converted for 220v, and we have to reverse that. alan

Hi Alan,

I will take a look and see what spare iron I have in the shed.

One comment about those site transformers; I had some rewiring done in the house recently and afterwards the main breaker that supplies the shack kept tripping each time I powered either of my two site transformers. I found that was due to the inrush current when you power up, and uprating the breaker cured it.

Also, I had a few problems with the protective multiple earth breaker going off when I powered up the BC-610. This I traced to the grounded secondary centre tap on those site transformers, removing the tap cured the problem. The tap is there to ensure that the maximum voltage on a power tool is only 55 volts above ground and thereby reduces the shock hazard.

I now have one untapped transformer dedicated to the '610 and no trips.

Hope this helps, I will send you e-mail about the Choke.

Hi Dennis,

Yes, that's right, the worst shock you should get if you cut through
the power cord or drop the power tool in a puddle is 55 V to ground.
I've not had to put that to the test myself :-)) but it's now
mandatory in the EC for all power tools in the workplace to be 110V.
Only a matter of time before the HSE police extend that to the home, IMHO.

power up, and uprating the breaker cured it.

Also, I had a few problems with the protective multiple earth breaker
going off when I powered up the BC-610. This I traced to the grounded
secondary centre tap on those site transformers, removing the tap
cured the problem. The tap is there to ensure that the maximum voltage
on a power tool is only 55 volts above ground and thereby reduces the
shock hazard.

I now have one untapped transformer dedicated to the '610 and no trips.

Hope this helps, I will send you e-mail about the Choke.

That may not be actually beneficial, in some cases.

Take me, for example. I chose to have the messages delivered to my inbox, on my local mail client. When there's a need, such as look at pictures, or grab a schematic or something, then I'll go to the actual web-site. Going there to read/reply/interact with mail is a royal pain.

So, probably the best answer is, you'll have to go -to- the Yahoo website (that's listed at the bottom of every message), log in, and see what all is there.

Congrats to the chap who recently came into an HT-4. Here's hoping you get your ham ticket, soon. As far as a dummy-load, any hamfest will have a dozen or so Heathkit 'Cantenna' oil-filled dummy loads. They're good for around a kW. Failing that, I'd find a 500w flood-lamp.

250TH's... on 28MHz? Oooo... that's not a good idea. While the tube-data sheets show 40Mc as the highest frequency, triodes, much above 20Mc, become (in my experience) 'unstable'. I don't know the exact correlation, but I'm guessing it has something to do with the thoriated tungsten in the filaments and the extremely fragile grid-cage that limits the frequency.

Hi Robert,

Thanks for the clarifications. The details are so important to have them right. Have you tried contacting the author or webmaster to set him straight?

I kinda wondered about that claim about the 35' whip antenna. I could see a fix or telescoping antenna being 35' but all the whips I have ever seen are typically 15' or less. I chuckled over your remark about driving around with one. My imagination started running wild.... "watch out of that tree up ahead..dang! Whack! Darn! There goes another antenna! Darn, darn darn! They told me to watch out for trees, wires, overpasses....oh, how will I explain this to the supply sargent, again".

Ah Guys,
Some of the "corn-fusion" is most likely from folks watching the
hallicrafters
story of the BC-610 used in the pacific theater actions.

As a clarification, there are whips for use on trucks, 15 ft, usually, the
AN/GRC-26
started out with a BC-610(*) and BC-34X series receivers, and a BC-939(*)
antenna coupler. The receivers were connected to the two whips forward of
the
shelter (when mobile) one for each receiver. The BC-610(*) was connected to
a third whip antenna at the rear of the shelter, that whip was matched to
the '610
by the BC-939. A note of great importance here, it was NOT advisable to lean
against a parked AN/GRC-26 when the transmitter was operating as RF Burns
would and did result.

AS for the 15 Ft. height thing that I believe was an arbitrary number that
came
about in dealing with the "Wire Rats", who usually ran their WD-1 wires down
the sides of the road,
mostly in ditches, but sometimes up in the trees so they wouldn't get snaged
by passing vehicles, at that time I think the tank retrieval vehicles were
the
tallest if the boom was in use at about 20 feet, the whip antennas on the 2
and 1/2 ton trucks and the
jeeps and 3/4 ton vehicles all used the 15 ft length, some were allowed to
be
vertical, most were indeed bent forward or rearward to lower the overall
height.

As for the "35 foot vertical, Not happening for mobile use as even though
there were not a lot ov over-passes, there when tunnels through the
mountains
in the European countries, mak height approx. 25 feet, stick a "Duece and a
half in there
and that doesn't leave a lot of room.

Sorry, HT-4/BC-610 transmitters were never called TBL or TBK or any such Navy nomenclature. The TBL and TBK, etc. Navy transmitters are completely different animals and they don't even resemble the BC-610.

No. I didn't try to get it corrected. The Army at Fort Gordon doesn't apparently appreciate being corrected. Several years ago I tried to get them to correct some errors in their listing of WW-II Signal Corps equipment but never had even an ACK. The errors are still there. Maybe I shouldn't have mentioned being Navy. :-)

Oh,
It doesn't have anything to do with being in the Navy, they have always been like that. I experienced it when I went there in the "Military" that attitude has always, in my opinion held that organization back from being a LOT better. Later as an Engineer we took radios down for a Communications Exhibition and pre-sales talk with customers from all over the "Free World". Everyone else asked questions, except the Officers and enlisted men from "Gordon", I remember spending an entire afternoon explaining to the Officers the advantages of "ALE" in a comms system, What a complete waste of an afternoon. It wasn't that they didn't get it, they didn't want it. Mostly because they didn't understand the technology, and "Didn't want anything with a micro-processor in it.

It was a good show, as we sold more gear there than even at The Exhibit at Heathrow, when we did the same thing there a month earlier. Funny thing was most of the customers were the same crowd.

Ah for the "Old Days" 8 - 10 hours flying, 2 hour setups for 3 hour shows, followed by 8 - 10 hours getting home. Just great.

When I was in service, I took a bunch of radio folks to P.R. only one crew came from Gordon, all the rest were from Bragg. Guess who couldn't get their equipment setup without help?

I'm going to assume you meant to write "guys" instead of "guts".

But in any case, the article says:
"The antenna problem was met after much experimentation by designing a
vertical whip some 35 feet long."

No qualifier there, other than that "some 35 feet" could mean "around 35 feet
or so". So it's either an error or a typo.

Now, I'm aware that at a halt, the SCR-299, 399 and SCR-506 were or could be
supplied with three each MS-54's and a guy set and put up and load a nominal
25 foot antenna. But not in motion. Besides the problems of the antenna
striking overhead objects, the antenna sections and mast base will not free stand
more than about 18 feet in any wind at all. Personal experience here. I've
used such an antenna (MS-54 to MS-49) for about the past 20 years mounted to
the corner of the garage (AKA Shack/Shop).

hi greg, the antenna mast as supplied, ms49 to ms 53 consists od screw together sections. this is guyed down by a special kit to about 45 degrees. we use it like this most times, as better range is obtained, when it is to be operated vertically, another two sections may be added. i think that this is where the confusion arises. better results are obtained using the doublet with 3 masts to support it.
we have found that for some reason, only the original feeder seems to work well unless an atu is used. we use a johnson kw matchbox.
the bc 939 works really well with the whip, but i have never got it to work with anything else. cheers, alan g4gen

Hi Robert,

Thanks for the clarifications. The details are so important to have them right. Have you tried contacting the author or webmaster to set him straight?

I kinda wondered about that claim about the 35' whip antenna. I could see a fix or telescoping antenna being 35' but all the whips I have ever seen are typically 15' or less. I chuckled over your remark about driving around with one. My imagination started running wild....
"watch out of that tree up ahead..dang! Whack! Darn! There goes another antenna! Darn, darn darn! They told me to watch out for trees, wires, overpasses....oh, how will I explain this to the supply sargent, again".

Best always,

Greg Farrell

# 3647. SCR-299/399 whip antennas

Yahoo group: T-368_BC-610
Date: 2009-02-10 10:06:55 UTC
From: g3vkm
Topic: 3646  Message: 3647

Hi All,

I've had similar experiences trying to use the BC-939, could never get it to load up a piece of wire properly, even when I used the lengths specified in the TM. Do the lower sections of the "proper" whips have some internal loading? I know that with whips I've used commercially some tended to have a helical structure embedded in the lower section to increase the inductance, one type I used a lot was made by the UK company Bantex.

hello roger, the whip sections are plain copper plated steel. with the short lead from the 939 to the antenna base, they load up fine .it is necessary to start with the correct settings. the ground is also essential. i have used them on all bands. cheers, alan

Oh no! No, I was just commenting on Robert's comment about "imagine a 35' whip antenna".

And from my days in the US Army, comment the whip antennas I had seen (I was Field Artillery, later Combat Engineers in the Nat'l Guard) were around 15' at the tallest in agreement with Robert.

My HT-4 is not mobile by any means.

Cheers,

Greg

Does anyone know about the BC-1335? I keep seeing that
nomenclature on crystals a lot.

Oh and RT-76.

The BC-1335 replaced the BC-659. It covers the same frequency band (27.0-38.9 MC FM) and uses the same crystals. It is smaller than the BC-659 and has a vibrator power supply built in instead of separate. It came into service in late 1944 and remained in service into the 50's.

My database does not show an RT-76. Perhaps you mean RT-176, the radio component of AN/PRC-10. VHF FM tunable packset covering 38.0-54.9 MC. Replaced BC-1000. Replaced by AN/PRC-25.

I have an -F parts set. Rear cover panel is rusty and will require stripping or bead-blasting and paint or powder coat. I think in most respects the -F, -G, -H and -I shared sheet metal but maybe someone with an -F and an -I can confirm that.

- Anyone know if the rear panels were the same in -F vs -I BC-610s????

Especially if the panel is the same, which stands to reason back when
things were done more logically hi hi.
I'm blessed with friends who know how to do that blasting...
Though of course, a panel in better shape would be easier to deal with.

So, yes, let me contact you off list on the -F parts kit...

Thanks to all!!

# 3660. Re: HT-4 Questions

Yahoo group: T-368_BC-610
Date: 2009-02-19 22:14:51 UTC
From: Greg Farrell
Topic: 3603  Message: 3660

Hi Barrie and all,

I just noticed I had not replied to your posting yet. Somehow it slipped by me.

> I'll dig that manual out and attempt to let you know what the differences are. In any case, you will need the manual for the HT-4, not the BC-610 (althought there are many similarities).

I received the HT-4 manual by post. It is only a small operating instruction manual, with schematics, diagrams and no photos.

Also included are manuals to the HT-4B, HT-4-I, HT-4C . I won't actually pick-up the unit until the 7th of March.

> From what few photos I've seen of the HT-4*, I don't believe that the knobs on your filament and modulation bias adjust are the correct ones.

I checked the manuals and other photos. The earliest HT-4 photo I have found so far(one in the photo section with the HT-4 next to a desk), shows all four with the spoked knobs. My HT-4B Manual shows it with only one large spoked knob. This image of the HT-4B(by caption) http://www.ominous-valve.com/images/vov44ht4.gif shows it with large knobs.

So I am confused a bit, but like you say, "wouldn't bother me".

> The HT-4* used the "steering wheel" knob on the final tune, but the knobs on the filament and modulator bias are much smaller. Not that it matters. It wouldn't bother me a bit.

> When I first fired my rig up, I used a 100 foot extension cord with a 150 watt light bulb in series. I'm glad I did, since the bulb lit to full brilliance, and one of the modulator tubes did the same.
>
> After I got things tamed, I used a 500 watt flood lamp as a dummy load. Actually made a one-way contact, with a friend, several miles away, listening to me, with the light bulb.

I thought with a dummy load you want pure resistance. A light bulb is inductive. Good ones don't appear to be cheap, so an oil can load might have to do (or a 500 W bulb)

> Some other things to consider would be: Are you getting a full compliment of tubes with the transmitter? The 250TH final, and the 100TH modulators are getting a bit scarce and more than a bit pricey.

> What about tuning units and final coils? You will need a TU and final coil for every band.

It does come with extra tubes, TU's and FC's. Which ones exactly I don't yet. I will have to shop around no doubt for extra 250TH's and 100TH's.

> Also, and I've asked this question in the past, with no response, does your HT-4 have four ceramic pillars, with banana sockets, on a shelf, in the left-rear of the RF compartment?

Don't know yet. You can't tell from the rf box photo in the photo section. I will surely let you know after the 7th.

> My transmitter does. I have been told that this was a socket for a fixed air-capacitor for operation on the lower bands.

Yes, I see this in the manual, C28 I believe.

> I have the socket. I do not have the cpacitor. I use a vacuum capacitor for operation on 160M. I have a 1.5 to 2.0 tank coil that I can use for 160M, without the vacuum cap, but it has a two-turn, fixed link. I can't load up to more than about 250 watts output with that coil.

> I use the 2.0 to 3.5 coil, with a 50 pf vacuum cap, for 160. I can easily load to 400 watts output with that arrangement.

Good to know. Many Thanks.

A light bulb is inductive??

How??

Even with a coiled filament it isn't.

Maybe slightly.

Joe,

I agree and started to comment this afternoon. The inductance in a light bulb isn't zero as it has a wire in it but it's certainly much less than the inductance introduced by the wires you have to use to hook it or a dummy load to a transmitter.

However, the resistance might not be optimum for the transmitter. Some of the early HT-4 and BC-610 plate tank coils have what appears to be a 300 ohm link. A 120 volt 150 watt lamp has a hot resistance of about 100 ohms (96 to be exact). So with a BC-610 and those coils you'd want three 150's in series. With a link with fewer turns you'd want to work up a different combination.

Now that we're into this discussion,

Nothing in the light bulb circuit is insulated for the voltage of a transmitter output either,... not a good idea.

The contacts are just too close together.  Even a ceramic socket is only rated at 660 volts.

Guys, I am still a bit befuddled.

1. What/which dummy load antenna should I get/use/make? What about those oil can loads? Light bulbs are not sounding good. In the movie VofV, the bulbs almost look like tubes(valves) with a rather hefty looking filament inside.

2. What/which SWR/Power Meter should I be looking at?

Thanks in advance.

Greg,

The ME-165 dummy load/VSWR meter will take 400W.

Try Fair Radio or the E-Payplace

Wb2FCN and I both use them with BC-610s

Actually, regular light bulbs and sockets are safe to use with an HT-4 or BC-610. The later coil sets with the rotary links will match 75 ohm coax as shipped with the doublet antenna kit that later became AN/GRA-4. Just to use an arbitrary number assume the transmitter output is 400 watts. 400 watts into 75 ohms produces a voltage of 173 RMS. The hot resistance of a 120 volt 150 W lamp is about 96 ohms.

Just as a quick and dirty load to test the transmitter, a pair of 150 watt lamps in parallel would work OK. It would take some calculating to figure the lamp bank required to accurately match 400 watts into 75 ohms.

There wasn't any SWR or power meter built for the BC-610. However, the ME-165/G made for the T-368 will work OK.

Greetings to everyone in the group!
I am Steve Gomez, ke5o, over in Beaumont, TX and just discovered you guys last week. My people! I know Robert in Houston and have known Perry in Beaumont for a gazillion years.
After joining I uploaded some photos of my projects to the photo section. Shown is an HT-4 that I have had for about 5 years.
The dummy loads shown in the VoV film were actually available from Ohmite and were not light bulbs, but made for that purpose. The ad

shown is from the 1940 handbook.
I also have a pair of 610-E's that I hope to use in restoring an SCR-299 and '399.
Also in another section is some photos of a '299 and '399 that I got to ride in each one in Italy last April during a terrific WWII MV operation. I will tell ya'll about that later if your interested.
73 to all,
Steve

> Greetings to everyone in the group!I am Steve Gomez, ke5o, over in Beaumont, TX and just discovered you guys last week. My people! I know Robert in Houston and have known Perry in Beaumont for a gazillion years.After joining I uploaded some photos of my projects to the photo section. Shown is an HT-4 that I have had for about 5 years. The dummy loads shown in the VoV film were actually available from Ohmite and were not light bulbs, but made for that purpose. The ad shown is from the 1940 handbook.I also have a pair of 610-E's that I hope to use in restoring an SCR-299 and '399.

Steve:

Good grief, HT-4s are coming out of the woodwork!

I've had a very nice HT-4B for over 20 years. During that time, I've put a bit of effort into attempting to discover how many HT-4s there were still in existance.

Until recently, I had uncovered none. Now we have 3 on this list.

My HT-4B was on the cover of ER sometime in 1992.

I've been using my HT-4 quite a bit recently on 75 and 160M. I'm listening right now on 1945, with the SX-73, for the evening get-together to start.

A question: Does your HT-4 have a shelf, in the left, back corner or the RF compartment, with four vertical standoffs, with banana sockets for the 160M air-padder?

Mine does. I'd sure like to find an original air-padder for that socket.

Perhaps we could arrange a sked? An HT-4 to HT-4 QSO would be fun!

73, Barrie, W7ALW, Since 1950

Hi Barrie!
Indeed it does have the pedestal (socket) for the padder but I have not seen one either (except in VoV).
I just received a 160m PA coil from Fair Radio so maybe someday?
The TX is in my "museum" here at work but would probably not take too much to set up an operating position. Ht-4 to HT-4 would be cool.
We'll keep you posted.
73,
Steve

What is the value of the air padder? I might have one.

Steve - nice HT-4B example. That Italian vintage SCR-299 is incredible. I had no idea they were into this sort of thing. And where'd they find it? It looks brand-new (the 299). Did the Italian Army inherit a bunch of them after the war?

Barrie - allow me a few months for development and maybe I can key with you guys on the HT-4. I do have to engineer the antenna (right now I have a long wire geared for receiving not transmitting) and most importantly, get that Technician license. You cannot imagine how motivated this very young, 59 year old man is! I feel like a kid again who just discovered ham radio.

Steve:

I'd very much like to have a copy of that HT-4B manual.

I have an HT-4 manual and a BC-610 manual, but the HT-4B is different than either (I've discovered).

It was an awesome experience riding in them and everything worked!
Other vehicles had different kinds of radio equipment but they had a
nice example of a forward air control jeep called "Rover Joe" that
was equipped with a BC-191/BC-312 for hf and an SCR-522 VHF radio to
talk to the Thunderbolts. I will have to ask them where they came up
with the trucks.
FB on the license, hope to hear you soon!

hello guys, you may have seen pictures of our scr 399 truck.it is in excellennt condition, and all we had to do was rebuild the roof.we used the original canvas construction, as it is easy to get from yachting suppliers. the history was that it was used in the battle of the bulge, ans when the americans began chasing the germans back home, they left a lot of stuff in luxembourg. this was given to the luxembourg army after the war. at least that was what they told us. there are a good number of things like this in europe, as many armies carried on using them for a long time. they ware as good as most replacements !
if you consider the bc610/bc342, it provides reliable communications for ranges up to several hundred miles as effectively as it did during ww2.
at the beltring military vehicle show , we worked into russia and hungary on the whip antenna. alan g4gen

# 3682. SCR-399s in Europe

Yahoo group: T-368_BC-610
Date: 2009-02-27 18:40:45 UTC
From: rbethman
Topic: 3682  Message: 3682

There were a number of warehouses in Europe/NATO FULL of these in the '60s. It was part of the "pre-positioning" of equipment in the event of the outbreak of war.

They were totally complete, and housings were mounted on M-35s.

It is no surprise that they may turn up from time to time, as in Italy.

Lost track of these over the decades. The BC-610s went through Depot in the late '50s. They were updated and the nomenclature was changed to T-213. I have ONE T-213, dated "Depot - JUL 1959".

Stenciling was used to re-mark the panel(s).

Yeah, Hi Alan,

I was looking at your SCR 399 photos
http://groups.yahoo.com/group/T-368_BC-610/photos/album/1843358178/pic/list

When I was in the Army National Guard (Engineer Unit) here in Santa Rosa, California, we had 2 or 3 of the shacks (just the radio room not the truck) in our yard and they were used for storage of all things. Most all the gear had already been stripped out. At the time I didn't know of their historical role but there were exactly like in your photos. I will have to check if they still have them. That was 15 years ago now.

You guys are wonderful at restoring and preserving the old equipment.

Cheers,

Greg
Santa Rosa

SCR-399-A,B became AN/GRC-26. At or about the same time, BC-610-F and later started going through Depot and coming out as T-213/GRC-26. The refinishing specs for the overhauls must have been fairly lax. I once owned four of them still in the Depot crates. Three were semi-gloss black and one was black wrinkle (it had started life as a BC-610-F). The lettering quality on the front panels varied from looking like it was original factory to looking almost like it was hand-lettered.

When we went out in the field on training exercises, BN HQ took "theirs"
out.

We loaded up the "field" BN Aid Station.

The GRC-26s were running RTTY for messaging.

Roger,

That holds with our experience!

The Depot work the "last time" wasn't done very well on the "finishing" touches! ROTFLMAO

However, I will have to say the insides were well tended to. I only found ONE wiring/soldering point that wasn't up to par. It was the end of the oscillator chain. No support for the solder joint. The solder broke with all the transporting around the country.

The 2 1/2 ton trucks as have been posted by you and your European Brethren were taken out of service about 1962/1963. I saw large lots of these parked end to end/side by side as they went out of service. The funny thing was that they ALL had automatic transmissions! Of course, these "were" Air Force.

Well, there is "still" a lot of items that are put on sale at DRMO sites.

How about $1500 NEMA equipment racks for $75 each?

I've got three sitting right here NOW.

Just start getting into the Military Surplus sales.

You don't know what you'll find until you get in, look at the lots that
are for sale, and decide "if" you want to get in.

ICBMs? No. Electronics? By the pallet load, constitutes one "lot".

Some time back when i was going thru boxes out in the shed and garage i found one of those padders.  Couldn't figure out what it was for as it plugged into something like what you guys are talking about.  Now i wonder where it's at.  Might be just what is needed for your HT-4 transmitters.

Hi Barrie!

Indeed it does have the pedestal (socket) for the padder but I have

not seen one either (except in VoV).

I just received a 160m PA coil from Fair Radio so maybe someday?

The TX is in my "museum" here at work but would probably not take too

much to set up an operating position. Ht-4 to HT-4 would be cool.

We'll keep you posted.

I wonder just how many of the SX-73's are still in use?

I have three. All R-274's... One A, one D and one no letter at all.

Was there ever a 'B' model?

I've found that the R-274"C" model was actually the Hammarlund SP-600.

I know Lum/K5AYD in Cache, OK has an SX-73. Dave/W4QCU in Oak Ridge, TN has one...
and on this list, now there's another. How many made it back?

I was just kinda curious as to where the rest of these wounderous machines where.

Geoff,

I've never owned any of the receivers themselves but my information, substantiated in part by the appropriate TM 11's or NAVSHIPS, is that R-274/FRR and R-274D/FRR are SX-73's. R-274A/FRR and R-274C/FRR are SP-600-JX's. And R-274B/FRR (apparently a Navy set) is SP-600-JX6. There is a table in TM 11-851 with a long list of mostly minor changes between R-274A and R-274C, plus further changes in R-274C at higher serial numbers.

There is a photograph in the TM specifically identified as R-274A, and it is an SP-600. If one of your SX-73's carries an R-274A/FRR nameplate, someone must have done some switchy-swappie.

I have a mint R-274/FRR (SX-73 in civilian...) I use regularly since I put it back on line about 6 months ago. I love that receiver! One of the things I love about it is that the plate voltage really low. All the caps are original, except for the bias voltage filter cap which was shorted, and I had no RF gain control - it was wide open as the bias voltage was grounded via the grid resistors and the shorted cap. This is after having the receiver on the shelf for 6 years without powering it up during that time. Interesting that of all the caps a 50VDC rated cap went bad (in a 30 VDC circuit) and none of the HV bypass caps...

Robert & Geoff,

Somewhere in the fray, the R450/FRR-28, a SP-600 J-11, (NO X), was
modified by Northern Radio for the Navy. It is tagged as NO bsr 57519.

They cover from 540Kc to 54Mc. No crystal slector, NOR even the hole
where one "might" have been.

OK. I don't have anything on an R-450 or AN/FRR-28. Sounds like it would be an SP-600-J something. I forgot to add in the previous (since it was actually aimed at what was SX-73 and what wasn't) that R-320/FRR, R--483/FRR and R-483A/FRR are further modifications past R-274C/FRR. All are covered in TM 11-851 on AN/FRR-12D.

Robert,

The Northern Radio modified SP-600 is an SP-600 J-11.

We've NOT located a Military manual for these. The ONLY documentation
is from Northern Radio.

They are pre JX.

We DO know they are NOT in line with the SX-73s, BUT - placing them in
the time line of the entire series is problematic.

Just to confuse things a bit more, I have a nice R-320/FRC which is
the RCA SC(Signal Corps)-88. Wonder what differed enough to require a
new receiver and nomenclature?

Geoff, I recently saw 4-5 of the SX-73 variants while visiting a
friend, didn't get to look each one over for differences. It's one of
the few receivers I'd still like to add to the stable here, once the
load is lightened a bit more. Over the years I've seen a few that were
tagged clearly with Hallicrafters SX-73 plates and no mil tags. Not
sure if the tags were just missing or they were civvie versions.

>

Well, now you've got me wondering, Bob.

I don't have physical access to them, at this time. Moved to Houston
back in August, and the major bulk of my gear is still in San Antonio.

I hauled what I thought was the 'A' model to Perry/W5KGZ in Beaumont,
just yesterday. Maybe he'll chime in here, and let us know if it says
'A', or just "R-274/FRR". That was the 2nd SX-73 I obtained. Bought it
from a one-time AM operator in SouthWest Louisiana.

The first SX-73 I owned was procured from the late John Mohn/W5MEU. It
is the 'D' model. John(R.I.P.) was a long time AM'er, haunting all of
the HF bands with side-by-side BC-610's (E and I), and a Johnson Ranger
I and II for 10m. John was a BC-610 expert and master restorer, and one
of the most knowledgeable fellows known to ham-dom on the restoration
and resurrection of R-390's of all makes and models. John and 'Ozona
Bob' were best of friends. I bought the Hallicrafters from John in
1986. The third SX-73 I got in a trade with KC5MIP. My dream was to
have all three receivers in a rack, each with it's own antenna, and the
outputs delivered to a mixer with one speaker. Probably not what some
purists call 'true diversity reception', but QSB could probably be kept
to a minimum.

I've long dreamed of having a 'killer' antenna system, for 75m.
When I was younger, I wanted a 180' tower, with inverted V antennas
strung out from heights of 180', 120' and 60', feeding all three at the
same time.

A little later in my ham career I wanted a pair of 180' towers with
flat-topped dipoles at the same heights as described above, fed with
open wire transmission line.

Now, I'm thinking that a pair of Delta Loops, 90 degrees spaced and phased, with a steerable radiation pattern is desirable.

Of course, this is still just a dream. Currenty I'm 'cliff-dwelling' in an apartment and there's not even enough room here to put up a decent 2m antenna :-(

Thanks for the input, Bob.

Long time family friend and old AM'er Paul/K5DKM(sk) had an Civilian
SX-73. I had it in my possession for a short time. I regretted letting
that one go. There was no difference that I could see in it, and the
R-274 version of the SX-73, except for the plates. Tube line-up was the
same (including that rare piece of unobtainium called the 6-4 Ballast
tube), as well as the RF input and I.F. output connectors.

It just came to mind, that there's yet another Beastly-610 over in the Beaumont area...
Frank/AA5IT has an E model (I believe).

He and his wife now have a young daughter (1? 2 years old, now?) and thus his time is limited for operating.

Frank uses out-board audio to drive his 100TH's, but I don't remember if he said he was going through the BC-614 or not. He's probably using the line-level input to the 2A3's, and feeding that with a high-quality mic, into a mixer/eq rack type of setup.

Geoff,
Sorry we missed you at the hamfest but we had a good visit with Perry.
Frank is also a good friend of mine and I have invited him to join the group.
His is an "I" model and looks great. Here it is on his web site...

http://aa5it.dyndns.org/AM.htm

Hope to meet you soon!
Steve

# 3710. Another HT-4 Question, the Carbon Microphone

Yahoo group: T-368_BC-610
Date: 2009-03-02 01:36:53 UTC
From: Greg Farrell
Topic: 3710  Message: 3710

Users of the HT-4 and later models used a table top carbon microphone on the HT-5. Does anyone know the type or model of the microphone used?

Then the ultimate question: where might I find one that is somewhat original?

I know this is a dumb question but I can't find anything specifically in the manuals I have.

BTW, I have the original manuals for the HT-4, HT-4B, HT-4I and a good copy of the HT-4C manual. If anyone needs a copy, I can scan it or scan specific pages for you.

At the last minute, Friday evening, my dispatcher put a load on me, picking up at 8am, in Stafford, TX (SouthWest Houston). Sometimes, machine shops, like this one, work late on a Friday, to get their created product picked up early on a Saturday and delivered on those rare occasions when a delivery -must- be made on a Saturday. I left north Houston at 6:15 and drove the 40 miles to get there early. Got there at 7am, taking the chance that being able to pick up the load early was the case. Bless their heart, those guys worked around the clock, and had been up some 29 straight hours, machining the parts that needed to be delivered. Not only was it not ready by 8am, the 'boss' had called my company at 6am to bump me back to 9:30am. The parts weren't finished and loaded in my truck, until 10:45am.

45 miles back to North Houston, dropped it off at 11:45am and then came home, loaded up two Viking II's, an SX-73, three chokes (a 20HY@580mA , an 11Hy@500mA and 10Hy@500mA - Perry wanted to build a modulation reactor to protect his BC-610 modulation transformer) a 4uf @ 4kVDC oil-filled cap, an 855v@1amp plate transformer and a box of associated parts for building an 811 rig. A single 811 in the final, modulated by a pair of 811's (I plan on putting it mobile, using a DC inverter to generate 120vAC for the B+ supply). ~130w of AM Carrier, high-level plate modulated, should sound pretty good into my bug-catcher.

Yup,

You should always check that "To" box before you hit the SEND button!

You just never know.

A few years ago I did switch the procedure to default replies back to the list because the answers to questions weren't showing up to everyone, basically, we couldn't keep a conversation going.

I DID notify everyone about it, too.

BUT! Every list is different and Yahoo changes their style every once in a while.

So, ALWAYS check the "TO" box before hitting the SEND button.

Sorry 'bout that,

Joe

The ME165 (SWR/PM/Load) arrived today from Fair Radio.

http://www.fairradio.com/catalog.php?mode=viewitem&item=2281

It looks brand-new out of the mil-spec box! Not a scratch on it and the type-N Female connectors have never been touched.

This one is a Barker and Williamson. I'll get some good use out of it.

Thank you again, gentlemen!

Greg,

That's a Signal Corps T-32. It was issued with the SCR-188 (for the BC-191) and may have been issued with the SCR-499-A (for the BC-614-E). I'm not really familiar with how the various HT-5 models differ from the various BC-614 models but the BC-614's all have two mic inputs, carbon and low-level high-impedance dynamic. The T-50 hand-held dynamic mic was issued with the SCR-399-A. But a D-104 works OK. When I was living in West Monroe years ago (early 70's), I used one with a BC-614 and BC-610-F. Only problem compared to a T-17 was lip burn if you had RF floating around in the shack.

But anyway, the T-32 should work fine with the HT-5. Wish that I had seen it first. :-)

# 3720. RE the Carbon Microphone

Yahoo group: T-368_BC-610
Date: 2009-03-05 02:12:46 UTC
From: Trevor
Topic: 3720  Message: 3720

Very interesting-

when I was a kid in the 70s, I used to haunt a surplus store that got the cast offs from Fort Monmouth's Signal Corps HQ. I bought one of these mics, missing the switch, and with a defunct carbon element, for $2 out of a junk bin. By the markings, it clearly was ex-military, but I never knew what it was from- and always wondered. Used it with a new switch and element with several rigs, and now I know the rest of the story! It's still in a box in my attic.

Just so you guys know what has happened, thanks to Joe Munson, I was pointed to a carbon candlestick microphone.

See eBay Item number: 110357591049 Stromberg Carlson candlestick microphone

You are most welcome,
I have/use four of the ME-165 units, 1 w/ T-368, 1 each w/BC-610(E)
and BC-610(I), and one for everything else.

A quick question, do your output coils have the swinging link or fixed
link? Both of mine have the swinging link, and when tuning up I set the link
for the power level I want into the dummy load, then make no further
adjustments to the coil. After my ME-165 the line goes to the Johnson
KW matchbox, then to open wire feeders to end fed long-wire, 153 feet
long +- winter weather, Hi!

Good luck, es 73
Jim

hello guys, great to find a mike like that. perhaps some kind soul could help me. we are after the typewriter for the scr 399 set up. it is the army/navy typewriter, portable wiith telegrapher's keyboard.
if anyone hears of one going, i would be most grateful.
regarding mikes, our scr 399 came with the dynamic mike, by far the best, and two T17 carbon ones.73s alan g4gen

They were also used with a number of other rigs like the BC-191. I have several different versions including one with a smaller, swivel-mounted head.

Hi Steve,

"Fireball XL5" was the programme that still was taken from, they still show "Thunderbirds" and "Joe 90" and some of the other spin-offs over here! I think they fall into "cult viewing" or something! I will have to keep an eye on the channels that show them, maybe some other BC-610 bits will show up.

Roger,
It makes one wonder which surplus store Gerry Anderson did his shopping at? I posted another with an ARC-5 receiver dial in it. I am sure there is not a large percentage of the audience that would catch that kind of stuff.
Cheers!

Hi Steve,

Yes, of course when that series was made there were any number of surplus dealers around, especially in the Tottenham Court area of London. The British army used BC-610s and I have a couple of PA coils still in their REME packing form the 1960s. It's ironic that when they wanted some equipment to look futuristic for the TV series they used something 25 years or more old at the time.

Yes, a typical ground station would be a BC-191/BC-342 if it's not a vehicular setup, if 115 VAC power is available (generator). The BC-191 would be powered by one of the AC power supply models issued for it (if I recall 3 or 4), depending whether it's a fixed or semi-portable/deployable configuration. I can supply the model numbers from the documentation I have. The BC-342 of course is the AC mains powered version of the BC-312.

Alan,

As Meir indicated, there were two Transportable sets built around the BC-191. SCR-177-(*) was a pack set using receiver BC-189 originally and then BC-312 and BC-314. The receivers were run off of batteries and the transmitter was powered by a PE-49 gasoline engine driven generator (output 12VDC and 1000VDC). SCR-188-(*) used BC-342 and BC-344 receivers and RA-34-(*) rectifier supply for the BC-191. If AC mains weren't available, PE-75 or probably anything else available was used.

FWIW, the set using BC-610 that was equivalent to SCR-188-(*) was SCR-499-A.

Alan,

SCR-177, 188 and 499 were MF/HF only. If VHF was needed, they would probably have used SCR-624. It uses the same radio receiver/transmitter as was part of SCR-522 and SCR-542 but with RA-62 instead of PE-94 or PE-98. And was powered by either PE-75 or AC mains.

Incidentally, the VHF radio has no nomenclature of its own. Only case I can think of. Probably partially responsible for people erroneously calling it SCR-522.

Yes, I don't know why it was done that way as in the beginning they couldn't have know that there would be several models of the receiver, transmitter and mount. There are several SIG STK NRS whereby you could order the complete radio without the cables, control boxes and etc.

Incidentally, I just noticed in SIG 5 that there was an SCR-522-AB. When I first saw it on the Alpha list I thought it was going to turn out to be a composite of the -A and -B models, maybe like "we'll ship whatever is on the shelf". But when I looked up the stock number, all that it said was "Classified higher than RESTRICTED". Note that RESTRICTED is equivalent to today's CONFIDENTAL. So in today's terms, it was classified SECRET or higher.

Good luck on the PE-95. I've never been into one although I once owned a -G.

Yes, I don't know why it was done that way as in the beginning they couldn't have know that there would be several models of the receiver, transmitter and mount. There are several SIG STK NRS whereby you could order the complete radio without the cables, control boxes and etc.

Incidentally, I just noticed in SIG 5 that there was an SCR-522-AB. When I first saw it on the Alpha list I thought it was going to turn out to be a composite of the -A and -B models, maybe like "we'll ship whatever is on the shelf". But when I looked up the stock number, all that it said was "Classified higher than RESTRICTED". Note that RESTRICTED is equivalent to today's CONFIDENTAL. So in today's terms, it was classified SECRET or higher.

Good luck on the PE-95. I've never been into one although I once owned a -G.

Alan,
Do the have more than one of the SCR-522? I am interested in putting together a "Rover Joe" jeep setup.

Steve,

Unless you are going to install a 24 VDC aux generator in the Jeep and use a BC-375, technically you need part of an SCR-542 with dynamotor PE-98. Not SCR-522 with PE-94.

Sorry about that Robert!I am mainly looking for the transceiver. I already have a 14V PE-98. There was a pristine example of an AC powered ground station on ebay recently but was rather expensive.

OK. I have two or three of the radios but couldn't say what condition they are in as I haven't looked at them in eons. Also have at least two RA-62's. And some of the connectors but no pre-made cables. That's about all I have of the SCR-624. I sold my nearly complete one to another collector several years ago.

There aren't many of the SCR-624's around. No one wanted them for decades and almost all probably got scrapped. I've had three at one time or another. Brent found some several years ago and I bought two of them but I don't think he bought one. But in any case, the only thing they would share with AN/VRC-1 is the radio and maybe some of the cables.

Hi Alan,

I could hire you my SCR-543, the BC-669C, PSU and the proper transit cases!! I think it was primarily a set for gun battery control. Needs an antenna but your whips from the 399 would do.

Cheers,

Roger/G3VKM

# 3747. MSS as VFO

Yahoo group: T-368_BC-610
Date: 2009-03-15 20:40:47 UTC
From: Barrie Smith
Topic: 3747  Message: 3747

Hello:

Anyone here used the Meissner Signal Shifter as a VFO on the HT-4/BC-610?

According to the manual I have for the Shifter, they run twisted-pair from the Shifter to each end of a 2000 ohm, 5 watt pot (?) or rheostat. Then, one end of the rheostat winding goes to ground at the crystal socket. The wiper on the rheostat connects, through a 500 pf capacitor, to the hot terminal on the crystal socket.

I'm assuming that the pot, or rheostat, is used to vary the power delivered to the crystal socket.

The manual is not specific as to whether this resistive load is a pot, or whatever. Seems to me that the load should be non-inductive. I've never seen an adjustable non-inductive resistor.

There may be other, perhaps better ways, to couple the Shifter to the crystal socket.

Comments?

I would be interested hear what you find out Barry, I have a Signal Shifter that I was planning on using as a VFO for my BC-610, soon as I am able to get the BC-610 back on the air. I have heard that it was a popular combination just post war. One method of interconnection that I heard of was to use 300 ohm twin lead to a old ft-171 crystal holder and just plug it in, but a method to control the amount of drive seems like it would be necessary.

Dave:

Yes, I would certainly think so. The shifter puts out 6 to 8 watts, depending upon the band. That's too many watts to put into a crystal socket.

There was an article in Electric Radio a few months ago relative to this subject. I believe all that was done there was to put a variable capacitor in series with the hot lead.

Thanks Alan,
Robert is a short drive away and I need an excuse to visit.
I think the PE-95 conversion is just a matter of re-wiring the stator from series back to parallel for 115V, on the main terminal block below the control panel.
Good luck with the film project.

Subject: [T-368_BC-610] MSS as VFO

Hello:

Anyone here used the Meissner Signal Shifter as a VFO on the HT-4/BC-610?

According to the manual I have for the Shifter, they run twisted-pair from the Shifter to each end of a 2000 ohm, 5 watt pot (?) or rheostat. Then, one end of the rheostat winding goes to ground at the crystal socket. The wiper on the rheostat connects, through a 500 pf capacitor, to the hot terminal on the crystal socket.

I'm assuming that the pot, or rheostat, is used to vary the power delivered to the crystal socket.

The manual is not specific as to whether this resistive load is a pot, or whatever. Seems to me that the load should be non-inductive. I've never seen an adjustable non-inductive resistor.

There may be other, perhaps better ways, to couple the Shifter to the crystal socket.

Comments?

Hi All,

Been following this with interst. Anyone done a similar thing but using a VFO from an RCA ET-4336? If so, did the '610 TUs need any mods?

TIA,

Roger/G3VKM

# 3753. RF Output Chain with ME-165, Antenna Tuner, Feedlines etc

Yahoo group: T-368_BC-610
Date: 2009-03-20 16:11:30 UTC
From: Greg Farrell
Topic: 3603  Message: 3753

Could someone share their detailed designs for positioning, connections and arrangement of their Xmitter -> SWR/Power Meter/Load (ME-165) -> Tuner -> Feedline -> Antenna ? Photos are very helpful but nothing like a detailed block/wiring diagram. Pointers to references work also.

I would like to connect to an end-fed long-wire antenna similar to Jim's arrangement.

Greg

Greg,

No ancient Chinese secret. Although I can't say that photos or block diagram are available or necessary.

The only thing I can think Jim left out, is the Low Pass Filter being the FIRST item out of the transmitter.

I go from there to the ME-165, then to the Bird, then - switchable - either to tuned doublets - OR - to antenna coupler in MY setup to wire antenna. I use the BC-939. Jim uses a Johnson KW Matchbox.

Bob,

Cheers and thanks for your patience with my questions.

I'll be the first to admit, I am on the upslope of my learning curve with this transmitter (HT-4). Sometimes it feels like I still have miles to climb but yet there is never an end.

Why the low pass filter? The manuals make no mention of this but suspect experience over the years indicates it as a good practice.

What is a "Bird"?

BC-939, a very nice instrument. I see I just missed one on ebay, Item number: 120384512474

Every answer helps me move a step upward.

Ah, but isn't that the fun of learning something you -want- to be involved with? It's like untangling a mystery. Don't get bogged down in the minutia of it, at first, but time and experience will prevail and you'll have that transmitter singing on the air-waves in no time.

> Why the low pass filter? The manuals make no mention of this but suspect experience over the years indicates it as a good practice.
>

Parasitics are generated, sometimes up and into the VHF (and beyond) range. A typical low-pass filter, passes only RF from frequencies below 30MHz. Mostly due to community areas with Television transmitters on Channel 2 (just above 6m). The HT-4 (originally built in the pre-TV days) didn't have a lot of shielding in the RF area, and there's the lack of a parasitic choke on the plate lead of the 250TH. In todays RF sensitive environment, *I* personally think that an acceptable mod to bring the HT-4/BC-610 on the air would be the inclusion of an RF 'cage' of sorts around the final tube, along with a parasitic choke in the plate lead of the 250TH final amplifier tube. Most purist will bristle at the idea of modifying (some call it 'horrify') such a stately piece of equipment, but keeping with the times and spectral purity requirements of today, in my opinion, take precedence. A (dramatic) example is, while there still exists a working Spark-gap transmitter, it isn't demonstrated due to it's RF environment disruptive nature.

While it's true that we've come a long way in technology, with DOC (data over cable) and satellite that render Television impervious to RF Interference (RFI) it's more important today to produce as clean as a signal as possible.

> What is a "Bird"?
>

Bird Watt meters. Industry standard in power output, and Voltage
Standing wave ratio (VSWR) measuring instruments.

Hope that helped somewhat, Greg.

Most everyone else on this list could also benefit from the knowledge
that this list, like most others, is a text-only list. Graphic file
attachments, and html coded messages are stripped before the message is
sent to the masses.

You'll know when someone does this, as you'll see;

[Non-text portions of this message have been removed]

Just wanted all y'all to be aware.

Greg,

The BC-610/HT-4 CAN throw spurious emissions easily. The LPF keeps you from blasting them all over the world.

As to "What is a Bird?". Do an ASK.COM search on Bird Wattmeters. These are industrial standard watt meters. You'll need to get the peak reading option and either a 2000W or 2500W element, (slug), that covers the Ham Allocations.

As Geoff has said, parasitics are probably generated. The addition of a parasitic choke to the final plate lead probably wouldn't hurt.

However, I do NOT believe that an RF cage would be wise. The reason being that the cooling of the PA tube is by convection cooling. An RF Cage would inhibit this cooling. If said cage were to be added, then "some" means of cooling, i.e., SHOULD be added, unless one is blessed with a LARGE supply of 250THs.

I have tested the BC-610 AND the T-213 with receivers having their antennas draped over the aforementioned TXs. I have searched from 30Mc through 425Mc and have YET to detect ANY output of spurs indicating any parasitics.

I also left out the cooling methodology of some sort of fan. Since I do NOT advocate a cage, AND the tube data sheets CLEARLY indicate cooling by convection, I'd leave the cage "issue" alone. It could only create MORE problems than it solves.

I am NOT a purist that considers "modifications" to be "horrific" or "heresy". I simply have found that there really ISN'T any need to modify these particular radios.

There are 63 of these in the BC-610 registry, (different models interspersed), and I know of NONE that have PA Final mods done to them.

In some of the old, old Eimac Service bulletins I have, it's recommended to use nichrome wire for the plate lead to reduce parasitics.

This would be an easily reversible mod that may work as well as a choke.

Barrie,

We got you the first time. However, I'd like to see the Bulletins.

Due to the length of the plate lead and nichrome wire being resistive,
I'd be hesitant to do this.

A resistive lead will NOT act as a choke, UNLESS it is wound into a coil
of some sort. To add to the issues inherent, the PA section is VERY
sensitive to inductance.

hello guys. i was worried about parasitics and harmonics with the bc610. using the bc939 and a whip antenna, i could not detect any, and the same went for a doublet matched by a johnson kilowatt matchbox. without the matchbox harmonics were radiated using the doublet. they were not all that strong though. regarding forced cooling, if it was not considered necessary by the designers, even regarding the range of temperatures the set was called upon to operate in, i don' see why anyone should think of it. the shelter keeps nice and warm in winter ! cheers, alan g4gen

I told ya there would be those that bristle at the idea ;-) (just
kiddin' Bob)

Hey, when are you going to start generating TEXT-ONLY messages, instead
of html-coded messages, Bob?

Geoff,

I'll send TEXT ONLY to QTH.NET lists, YAHOO GROUPS ALLOW html, so I will
USE IT.

I still will NOT support an RF cage. The PA, 250TH WILL run hotter. If
this method of NO cage has worked since 194?, why mess with it NOW?

hello bob, you are right. the 250th runs very hot, and it is inadvisable to even allow cold air to blow on it as this can cause breakage i am told. natural air circulation is what it was designed for. cheers, alan g4gen

Every bit of information is helping. It is all bit puzzling for us newcomer at times. You have all been very helpful. I do read all your posts!

What I think I read is parasitics are not that much of an issue (based on you guys testing), so a LPF would not necessarily be a requirement. True?

Sooooo.....

I can cable from the transmitter to the ME-168, ME-168 to the AT-2 Antenna Tuner, AT-2 to the lead lines out the wall to the antenna (have some decisions to make there...like use ladder line, coax, twin coax etc). Will need some sort of balun there.

Managed to locate this helpful diagram on QSL http://www.qsl.net/n1lo/80mdblet.pdf

The ME-168 uses type-N connectors. Is there a handy adapter or way of adapting a transmission line from the XMTR output posts to the ME-168?

I won't run out of questions.

Greg,

The Low Pass Filter has NOTHING to do with parasitics. It has
EVERYTHING to do with HARMONICS!

Run on 20 meters without one, and you'll have a GOOD chance of ALSO
being on 10 meters. Hence the LPF.

Remember, the TUs can run fundamental, double, or even triple the
crystal frequency. Therefore, I would THINK that whatever you set the
M.O. at has the double and triple going from TUs and through. Reduced
strength - yes. But they are very likely to be there.

Parasitic oscillation is ENTIRELY different from harmonics.

this group, apparently, strips it. It's a settable feature, when the
group is setup. This group will keep stripping it out .

"[Non-text portions of this message have been removed]"

is sent on every mesage you send to the T-368/BC-610 reflector, Bob.

Ain't no biggie to me. Keep sending 'em! The group will just keep stripping it, anyway. ;-)

> I still will NOT support an RF cage. The PA, 250TH WILL run hotter. If
> this method of NO cage has worked since 194?, why mess with it NOW?

I don't see what you're getting you knickers all knotted for... I know
I didn't describe -what kind- of RF cage... shoot, for that matter, it
could just be copper screen, fer cryin' out loud, or even chicken wire.
How much heat you think can remain in chicken wire? ;-)

You know that device you carry on your hip, these days? The Cell
phone. Everyone has one. My, what marvelous wonders the technical
minds are, these days. Smaller, Faster, Cheaper.
Bottom line is, it's still a 2-way radio! It's the same thing as a tube
type transmitter with a receiver. only THESE Radios are full-duplex!

Do you not think that with a little knowledge and some advancement in
technology, that a device designed to operate in the 1940's could stand
to use some 'updates'?

c'mon... even YOU aren't wearing the same style of clothes you did in
the 1940's, are ya? ;-)

I knew _someone's_ back would bristle at the thought of horrifying a
piece of equipment. Me? I don't care. If it needs a hole in the side
to tune a series capacitor in the link output, then out comes the
drill. If I need to install a variable resistor to set the bias on a
solid-state, Class B Audio driver, then drill we will! Bottom line is,
whatever -that- little modification that I do, or whatever new circuit
gets installed, is for the overall BETTERMENT of the equipment! This
-is-, after all, 2009 and not 1940 any longer.

>

Why? Use open-wire line to a doublet. I've never had good luck with a
balun. In the 50 years I've been around ham radio (all my life) I've
seen baluns used, and compared A/B with/without baluns... always the
signal was better -without-.

It's not that critical of a thing at HF. You can solder wires to the
connector, from the antenna output posts, if you have to use a
connector. Those devices you are using between the transmitter and the
transmission line have connectors, and that's fine.

> I won't run out of questions.

we'll always have answers ;-)

That "thing" on MY hip is a .45 semi-auto. It certainly is NO cell phone.

My only beef with an RF cage, IS the heating issue - AND - Eimac specifically states cooling by convection. A chicken wire cage would be absolutely USELESS!

The "thing that is being stripped out is a "tag-line".

More like "WAR" stories or radios that people have needlessly modified.

Greg, you are using an HT-4 IIRC. Does it have a coaxial connector on the side as the BC-610s and T-213s? - OR - Does your's have the two porcelain feed-through with conductor on the left side?

The number of these manufactured for the government is NOT small. NONE of these EVER had a parasitic problem NOR a parasitic suppressor.

Geoff - demonstrate in the MANUALS

This is exactly why I ask lots of those pesky questions of you guys. I would like to engineer and implement this installation once, hopefully right the first time ;)

> Does it have a coaxial connector on
> the side as the BC-610s and T-213s? - OR - Does your's have the two porcelain feed-through with conductor on the left side?

It has the porcelain feed-throughs. I just uploaded some more photos too.

http://d.yimg.com/kq/groups/276946/sn/665987221/name/DSC03889C.jpg

I don't have a date of manufacture for old Serial Number 1882, but its an early "A" model.

> The number of these manufactured for the government is NOT small. > NONE of these EVER had a parasitic problem NOR a parasitic suppressor.

That's good news.

Greg,

The output of these animals is NOT 50 ohms. The antenna tuners for the HT-4, (AT-2), and the BC-939 (A) & (B) are NOT antenna tuners. They are indeed antenna couplers/ When feeding and end fed wire as Jim, WB2FCN, does. He DOES use the Johnson KW Matchbox. The reason he does this is simply the BC-939 has SPECIFIC wire lengths that they are designed for.

Barrie brought up nichrome wire for the plate lead. Nichrome wire IS resistance wire as is found in toasters. The resistance of this wire would be an RF loss mechanism AND a heater inside a transmitter that does NOT need ANY more heat. To achieve a "ckoke" effect, it would HAVE to be wound in a coil, thereby simply creating a heating element.

A parasitic suppressor is composed of copper wire in a coil, with resistor(s) inside the coil to absorb the parasitic oscillations created due to internal capacitance to the final. These are found on 3-500Zs, 4-400s, and 572Bs. (No doubt others)

I have the Eimac data sheets and bulletins on the 250TH. NO parasitic suppression is even mentioned in this documentation dating as far back as 1951.

My T-213 is a Depot modified BC-610. The ONLY thing I can find is that they removed the porcelain feedthrough and added an SO-239. There are NO Mods by the U.S. Government, EXCEPT for the two page change to allow the use on the Broadcast Band.

The HT-4 is the ONLY version of these that came with a TU and PA coil for 10 meters. The BC-610 "can" be put on 10 meters - CAVEAT - U. S. Government found that the radio cabinet/chassis to be crawling with RF. This is why THEY did not go for a 10 meter option.

Tuned doublets work fine with these animals. I use either the tuned doublets, OR I use the BC-939 with the SPECIFIED wire length.

They are NOT problematic to run. The use of LPFs is a precaution due to the fact that they WILL exceed legal power levels, AND exceed the legal limit. I found the peaked out by properly dipping the plate, I "could" pin the Bird's 2500W scale on Mod peaks. They take a "little" more effort than a ham only rig to properly operate.

I have YET to damage one of these wonderful radios. They were in use into the latter end of the '60s, and one was used at Arecibo, P.R. to communicate back to Ft. Bragg, even a bit later.

Get it up and running RIGHT. IF you are then compelled to play with changing things, enjoy. Jim and I are ONLY trying to get YOU going right. The ONLY real purpose to the ME-165 is for a shielded dummy load. Which we use for initial tune up and dip. Once that is done, you can take it out of the RF path. It really was built for the T-368. But it does the dummy load job for the approx 400W carrier very well.

No war stories or third hand info given here! Just the facts!

Bob - NoDGN

Call it personality differences.

Jim and I are trying to get him started initially.

Issues BEYOND the real everyday use of these is NOT helpful in getting a youngster to these Beasts up and running.

Does THIS answer your question? These are NOT the normal Ham Transmitters. They have their quirks.

You have done a lot of playing with 259THs and 304TLs in "custom" built gear. The HT-4s, BC-610s, and T-213s are NOT in the same category.

Well written, Bob. Thank you.

Short bio: 59 years of age. Worked at HP/Agilent RF/Microwave Divisions now almost 35 years. When I was a senior buyer, I managed all the vacuum tube and RF/MW components, including klystrons, Backward Wave and Traveling Wave tubes, YIG oscillators etc. Since a kid, always wanted to become a ham, build a system. I love tubes and having fun doing this. It may take me a year till I flip the switch. Am in no hurry, just want to do it right and hopefully not a lot more money (or my wife will leave me).

"mods perpetrated by ignorant amateurs in the 50s" Alan Moriss

Well Alan, I guess I'm one of those 'ignorant amateurs' you like to deride, and I take offense at it. As an impoverished teenager the only real radio I could afford was the Wireless Set No 19. They were available surplus here in Canada by the thousands, the cheapest price was 5.00 as is at a large scrapping yard to 30.00 for one new in the crate. But they were not very ham friendly and required modification to be of much use on the ham bands. We band spreaded them, stabalized the oscillators, put in crystal filters, plate modulators, you name it. I even tried to convert one to DSB!
Who could have possibly known at the time they would some day be treasures? And when you are bashing that generation of amateur, keep in mind this--if it wasn't for us buying and sometimes modifying equipment to use, who else would have bought it??? No one, and it would have all been scrapped.

73,
Keith VE3TS

hello keith, well, i being 74 years old was around then. i did all those things, fondly imagining i was improving on the original design. the sets did what they were designed to do, which was not ham radio. i have an 1155 from my schooldays, and never ripped out the df circuits as i considered it vandalism. i am very proud of my 1154/55 station had i butchered the rx this would not be the case. we all know better now, and ww2 radios are valuable antiques. you would not fit castors to a chippendale chair !
i have had my ar88 for over 40 years, and will always regret replacing so many components with modern ones all those years ago. by doing the mods, the eventual destruction of the sets was assured when their shortcomings became a nuisance. cheers, alan

I think Alan has unfortunately made the mistake of looking back at history through today's eyes. While few of us would think of making irreversible mods to a WWII rig today, there was nothing exciting, historical, or collectible about this stuff back then beyond someone actually being able to afford to get on the air with a lot more radio than they could buy new. In fact, as you pointed out Keith, much of it was scrapped for lack of interest. If not for the hams who bought these things and squirreled them away or the surplus shops who bought them by the truckload, we'd not have pristine ART-13s, BC-375, and NIB ARC-5/Command sets still showing up today.

For me, it was the late 70s and a surplus BC-455B Command receiver that went under the knife, a trade from a college professor who wanted an old Radiola III I had (to transistorize, no less!). He helped me rewire the filaments, add a BFO switch and RF gain control, along with a huge mil connector on the back apron to drive an outboard speaker removed from an old Philco console. Looking back now, it seems tragic that I could have done such a hack job to that receiver, but at the time they were still selling for $5 new in the sealed box and wrapper, not rare or exciting in the least bit. The trade off was, I gained not only an appreciation for the history of the gear, but also for its actual functioning abilities. The result has been my slowly accumulating the pieces for a 'complete' (if such a thing exists) ARC-5 station as well as the earlier ARA/ATA versions. No mods this time beyond substitutes for bad components. So the BC-455B served its fellow sets well, and still sees use from time to time on top of that.

The other thing we should keep in mind is that these sets are only attractive to us, radio nuts, or those fascinated by gadgets. How many museums do you know of with a BC-610 on display? What's the likelihood of that number increasing as we go forward? We shouldn't assume that just because we took great pride and care in something, that others will as well. This stuff has been going to the scrap heap for decades, in excellent condition, and will continue to going forward if we don't make other arrangements. We should be looking forward, not backwards, when we think of such matters.

Well,you guys hurting for doing mods to priceless antiques.
If i knew how to do it, I would take a deep diving sub and recovery ship out into the atlantic and park it over some secret coordinates, where I helped my uncle sams navy deep six crates of unopen never had the cosomoline wiped off pieces of radio gear.
Pick your favorites. They are there. In quantity.
The story they told us was that should they be released as war surplus, it would put the manufacturers out of business. Flood the market.
Reading the lables, I could have cried.. How about SX28  BC610 SCR...etc..
Soumds almost like todays  "sub [prime" stories. HI/...HI...

"mods perpetrated by ignorant amateurs in the 50s" Alan Moriss

Well Alan, I guess I'm one of those 'ignorant amateurs' you like to deride, and I take offense at it. As an impoverished teenager the only real radio I could afford was the Wireless Set No 19. They were available surplus here in Canada by the thousands, the cheapest price was 5.00 as is at a large scrapping yard to 30.00 for one new in the crate. But they were not very ham friendly and required modification to be of much use on the ham bands.

We band spreaded them, stabalized the oscillators, put in crystal filters, plate modulators, you name it. I even tried to convert one to DSB!
Who could have possibly known at the time they would some day be treasures?
And when you are bashing that generation of amateur, keep in mind this--if it wasn't for us buying and sometimes modifying equipment to use, who else would have bought it??? No one, and it would have all been scrapped.

73,
Keith VE3TS

Well written, Bob. Thank you.

Short bio: 59 years of age. Worked at HP/Agilent RF/Microwave Divisions now almost 35 years. When I was a senior buyer, I managed all the vacuum tube and RF/MW components, including klystrons, Backward Wave and Traveling Wave tubes, YIG oscillators etc. Since a kid, always wanted to become a ham, build a system. I love tubes and having fun doing this. It may take me a year till I flip the switch. Am in no hurry, just want to do it right and hopefully not a lot more money (or my wife will leave me).

Hi Bob,

I've been in the offshore survey business for years, running sonars and similar seabed surveying systems for the oil industry. We turn up the odd wreck but I'd guess from the state of them that any SX-28s or BC-610s in the cargo would be beyond help. The dumping of surplus gear at sea has always fascinated me (see the web for places like "Million Dollar Point" for instance) but I hadn't realised until recently how much equipment, stores and munitions were disposed of by burial on land.

Browsing the web, I came across records of UK parliamentary sessions where there were amazing questions asked about, for instance, 10000 RAF RX-TXs being dumped down an old mine shaft in England, some of which were still NIB. Apparently, security at the site was minimal and people were helping themselves as fast as the military could dump the stuff. This was in 1948.

When I started looking more into this subject I found that was just the tip of the iceberg and there were hundreds of sites around the UK alone where stuff was buried or chucked down shafts. Multiply that by a factor of maybe ten for US Forces surplus, add all the captured gear the Allies had and you can see that treasure-hunting on land might be a more profitable venture! Get that metal-detector out!

Topic: 3779  Message: 3785

hi todd, well, as i said, i was also one of them, but never really liked to butcher interesting equipment. that is why i have some pristine gear. i have a complete arc 5 set up which i must get on air and also the scr274. i have restored b2 spy sets,which now fetch around $3000. amateurs had drilled holes in the front panels and fitted modulators etc. they worked fine as they were, and i worked new zealand on mine once.
it is the same with classic cars. some people saw them for what they were and looked after them, others put truck bodies on them etc.
if you consider it, there are probably many more pictures by great masters in existence than bc 610s.
i saved the one owned by roger g3vkm from being scrapped. maybe in a hundred years people will marvel at it ! over the years i collected and stored a great deal of stuff which i have now sold on to good homes.cheers, alan

I think Alan has unfortunately made the mistake of looking back at history through today's eyes. While few of us would think of making irreversible mods to a WWII rig today, there was nothing exciting, historical, or collectible about this stuff back then beyond someone actually being able to afford to get on the air with a lot more radio than they could buy new. In fact, as you pointed out Keith, much of it was scrapped for lack of interest. If not for the hams who bought these things and squirreled them away or the surplus shops who bought them by the truckload, we'd not have pristine ART-13s, BC-375, and NIB ARC-5/Command sets still showing up today.

For me, it was the late 70s and a surplus BC-455B Command receiver that went under the knife, a trade from a college professor who wanted an old Radiola III I had (to transistorize, no less!). He helped me rewire the filaments, add a BFO switch and RF gain control, along with a huge mil connector on the back apron to drive an outboard speaker removed from an old Philco console. Looking back now, it seems tragic that I could have done such a hack job to that receiver, but at the time they were still selling for $5 new in the sealed box and wrapper, not rare or exciting in the least bit. The trade off was, I gained not only an appreciation for the history of the gear, but also for its

actual functioning abilities. The result has been my slowly accumulating the pieces for a 'complete' (if such a thing exists) ARC-5 station as well as the earlier ARA/ATA versions. No mods this time beyond substitutes for bad components. So the BC-455B served its fellow sets well, and still sees use from time to time on top of that.

The other thing we should keep in mind is that these sets are only attractive to us, radio nuts, or those fascinated by gadgets. How many museums do you know of with a BC-610 on display? What's the likelihood of that number increasing as we go forward? We shouldn't assume that just because we took great pride and care in something, that others will as well. This stuff has been going to the scrap heap for decades, in excellent condition, and will continue to going forward if we don't make other arrangements. We should be looking forward, not backwards, when we think of such matters.

hello guys, well, at the asphidistra radio station near me they buried a container load of german gear, including such things as hellschreibers. i know someone who worked there and he showed me where it was buried. on top they dumped several old cars and then filled it over. i bet some of the stuff is salvagable. trouble is that it is now grown over with trees. if i win the lottery i will have an excavation.
by the way it was called asphidistra after the gracie fields song "the biggest asphidistra in the world" as it was the most powerful broadcast station in the world.
it broadcast propaganda , misleading instructions to the luftwaffe and messages to agents. as a young boy building radios it was very morale boosting as you could hardly fail to pick it up. i could receive it using a razor blade and a pencil ! we received a certain amount of attention from the luftwaffe being near it, but they never scored a hit .
cheers, alan

Subject: [T-368_BC-610] Re:bc 610

Hi Bob,

I've been in the offshore survey business for years, running sonars and similar seabed surveying systems for the oil industry. We turn up the odd wreck but I'd guess from the state of them that any SX-28s or BC-610s in the cargo would be beyond help. The dumping of surplus gear at sea has always fascinated me (see the web for places like "Million Dollar Point" for instance) but I hadn't realised until recently how much equipment, stores and munitions were disposed of by burial on land.

Browsing the web, I came across records of UK parliamentary sessions where there were amazing questions asked about, for instance, 10000 RAF RX-TXs being dumped down an old mine shaft in England, some of which were still NIB. Apparently, security at the site was minimal and people were helping themselves as fast as the military could dump the stuff. This was in 1948.

When I started looking more into this subject I found that was just the tip of the iceberg and there were hundreds of sites around the UK alone where stuff was buried or chucked down shafts. Multiply that by a factor of maybe ten for US Forces surplus, add all the captured gear the Allies had and you can see that treasure-hunting on land might be a more profitable venture! Get that metal-detector out!

This thread is getting long but I just wanted to add my thoughts. I understand the criticism of modifying vintage gear but one really has to have "been there" to appreciate how it all happened. Growing up in the 30's and 40's hardly anyone was ready for the manna from Heaven that appeared after WWII. My Wireless Set 19 (complete in the original overseas shipping containers) came from Gimble's department store bought with paper route money! Unbelievable things were available from the darndest places for pennies on the dollar. Our Conservation Department (now universally known as DNR) ordered some crating lumber from the "Feds" and got a semi-truck full except---the crates were full! Full of tubes! When asked about it the answer was, "Oh just smash and bury them and keep the lumber" I got one of each type, many were transmitting tubes from the early warning radars installed along the English Coast. I also purchased with my paper route money a BC-375-E (complete in the original crates, I might add). When my neighbor returned from the South Pacific and saw it he remarked, "Well, I thought I'd seen the last of those, we used the tubes, 211's, for target practice and buried hundreds of those transmitters with a bulldozer before we left the island". So maybe some of you see why we thought it would last forever. I learned a lot by modifying that stuff and went on to three electrical engineering degrees and a satisfying career, so lighten up guys, it wasn't all bad.

How (or where) did Hams back in the day acquire BC-610's when they
became available on the surplus market? Seems like it would have been
harder to accomplish than it would have been for the smaller radios.

Any neat stories?

Thanks and 73,
Jason kf6pqt

Jason, I'll defer to others who may have more firsthand info, but I'd bet most hams obtained gear like this through the MARS program. At least the only one or two I knew of back in the day did. Army, Navy and Air Force MARS were all very active in the 60's and into the 70's at least, and participation in various activities, such as checking into the various nets held on non-amateur frequencies, conducting phone patches and handling traffic, etc., hams would become eligible to receive surplus equipment. I'm pretty sure it was all on a "loan" basis, but there was probably little chance the military would ask for gear to be returned, especially if the ham remained active in MARS. The Navy MARS coordinator for Nebraska lived near me and I remember him talking about taking a farm truck to the Great Lakes Naval Training Center near Chicago and hauling back a load over gear on a regular basis. I remember teletypes being the hot deal back then, as the newer models weren't readily available.

Warren,

Mine was made by Hallicrafters, but clearly a different contract
number, as seen in the picture of the tag that I attached,
3164-PHILA-51-01-c. Unfortunately the "44" doesn't show up.

Since my numbers are lower, is my rig older? do you have an
approximate date of manufacture pinned down for yours?

Thanks and 73,
Jason kf6pqt

It doesn't tell you the actual date of delivery but in the standard 1 to 5-digit, 2/3-letter, 2-digit (and optional suffix) Signal Corps Order Number (not Contract Number), the 2-digit portion is the US Federal Fiscal Year. Which from early in the Great Depression until the Reagan Administration began 01 July of the previous calendar year. You can make a rough guess as to where in the year the Order was written from the magnitude of the 1 to 5-digit part. Which started over at 1 each year. Most of the war years (both WW-II and Korea) the sequence number ran over 150,000. For a unit already in production like the BC-610-G or later was at that time, and with only minor changes model to model, I usually guess 30-90 days from order to delivery.

On the duplicate serial number issue, that was rather common. Although as collectors of the maybe 1/2% remaining survivors of the original production we don't run into it very often. Sometimes, if the same contractor got several successive orders for the same thing, serial numbers carried on. Or if orders were simultaneously placed with two or more contractors for the same unit the contractors may have been given a block of numbers (as with the BC-611-F). But sometimes (often?) they just started over at 1. Which is why in many TM's you'll see changes identified by both serial number or range, and order number.

Greg,

I haven't been really following this thread, just reading a post once in a while, as I had other irons in the fire last week and this. And I only vaguely recall that your transmitter might be an HT-4. But, yes, there are adaptors made to go between most coaxial fitting families. Although some of them are moderately expensive if you buy them new today, in surplus they usually aren't too bad. The easiest solution would be to simply use N connectors in the first place but the adaptor N Male to UHF Female is UG-146/U. N Male to BNC Female is UG-201/U. Etc.

The one thing you should never do except in a bonafide life threatening emergency is to solder to connector contacts on the end not made for soldering. Unless you never intend to sell the equipment while you are alive and expect your heirs to send it to the dump when you aren't. There are some connectors that you can solder to the pins or sockets of and later you or someone else can repair the damage but the N Female is not one of them.

On the BC-610's (so applicable to the HT-4), the cable connecting the transmitter to the BC-729 or BC-939 was coaxial with ring lugs both ends. Later BC-939's had an SO-239 installed and the cable changed to lugs one end and PL-259 the other. And of course, later still there was an MWO that installed an SO-239 on the side of the transmitter and the insulated posts were removed (or sometimes just disconnected). So the minimum cost and hassle cable for connecting HT-4 to ME-165 would be a length of RG-8/U terminated one end with ring lugs and the other with an N Male. At low HF the impedance bump caused by the ring lug end isn't significant.

Hi Bob,

The following was posted on one of my other Yahoo groups earlier this week:-

"Over the past three weeks we know that some of you have experienced a
few hiccups while using Yahoo! Groups. For this, we're sorry□ we're in
the process of moving to new data centers, a move which should enable us to deliver faster page loads, a more stable system, and an all-around better user experience.

Currently, about 75% of Yahoo! Groups have been moved over to the new
data centers and the remaining 25% of groups will be moved over in
phases between now and March 31st.

As is the case with any move, however, issues sometimes arise, which in this case have resulted in temporary delays or bugs. As a result of
this, some of you may be experiencing a temporary issue accessing your
files and we're working to resolve that now. We're sorry about any
inconvenience caused by these problems; and we appreciate your patience, as we work through these issues in an effort to improve your experience on Yahoo! Groups".

I'm still getting the occasional error message but refeshing a couple of times seems to restore the page.

Perfect! I have these! Also picked up a right angle type N male - female adapter.

I'd be careful with that right-angle adapter. Some of them are okay, some are junk.

On my HT-4B, I have a SO-239 installed in one of the holes for the ceramic feed throughts (completely reversable mod). My TR relay is installed right there with a male to male UHF adaptor.

Seems to work FB.

# 3804. BC-610 on cw

Yahoo group: T-368_BC-610
Date: 2009-03-29 23:51:46 UTC
From: kf6pqt
Topic: 3804  Message: 3804

I have heard talk that though the BC-610 sounds great on AM, thats not
so much the case on CW.

Is this due to guys using the tuning units without a crystal and getting chirp?

Or even with the crystal, are there keying issues? I've got an FT-171
xtal kludged into my DX-100, and it sounds great! ;)

Thanks and 73,
Jason kf6pqt

# 3805. Re: [T-368_BC-610] BC-610 on cw

Yahoo group: T-368_BC-610
Date: 2009-03-30 00:15:48 UTC
From: James M. Walker
Topic: 3804  Message: 3805

Howdy,
I run my BC-610(I) on CW on 40 & 20 meters, using the crystals
for the low end of the bands. On 40 it is 7030 Kc, same Xtal swapped
to the 20 meter TU, gives me 14.060, never had a bad signal report,
even when putting out 400+ watts.

A common problem with new folks hearing a BC-610 on CW is
their AGC is pumping hard, on their latest rice-box, and they don't know
what to do about it.

Having said all that, a description is in order, my CW station, uses a 0 -
130 VAC
25 Amp. variable Transformer (Variac, auto-transformer). The line that runs
to
that gear is direct from the main service entrance, and on its own circuit
breaker.

The "variac" is set to provide a stable 117 VAC to the regular AC input
connector.
I also have a separate line that goes directly to the HV transformer in the
"Beast",
see schematic for the (I) model I set the HV at 2 KV on the 250TH no more,
and
no less. Signal reports are 599 most times in the states, and out to
HI.-land.

Never had any bad signal reports on my units, on AM/CW or FSK w/850 Cycle
shift RTTY.

Of course if the line voltage is a single entry and single source, one might
experience
blinking lights in the house, and with the lights blinking the AC is most
likely
falling in time to the keying sequence, resulting in chirp and drifting down
and back up
in freq.

As usual YMMV
Jim
WB2FCN

Hi Jason,

It certainly chirps like mad if you use the internal MO but I think the main issue with the crystal oscillator is mains hum on the carrier. When I put my '610 back togther after a major clean-up I fitted an extra 470uF bypass capacitor to the cathode of the CO stage as per the article in the November 2004 Electric Radio by the late N6PY. I can still see a little ripple on the monitor scope but have had no complaints on-air. I use mainly FT-171 rocks, but have found most types work OK, even HC6/U or those tiny ones that Brian, AF4K, sells.

Just to clarify from Roger's message - some of the FT171B crystals
that I have are original WW2 era rocks for the ham bands.
Many of the others contain the smaller HC49 crystals, yet they work
great in the BC610 according to all reports. I test them all thoroughly.

Hi Alan,

I have a number of standard BC-610 3570 kc rocks and ground one down to 3575 with no trouble, using a piece of glass sheet and some "Barkeeper's Friend" mild scouring powder. I use it regularly on the Dutch SRS channel.

Alan,

Before you do that, let me check my stocks, I may have another couple of 3570 as they were a standard rock in the crystal box, I think. You might find the activity drops a lot if you pull the rock that far.

3570 isn't much use to me as there's a data carrier running there night and day over here in Norfolk - sometimes it's about the only thing I can hear on the CW section!

Hi Alan,

OK, I have two 3570, both work fine. I'll drop one in the post after the weekend. No, I have a crystal for 3510 already, do you have anything for Top Band, as I'm looking for rocks to suit the BC-669.

Hi Alan,

Have had a couple of those Harris rigs myself, good choice. I have the ops manual on disk somewhere.

ger, well, you may be able to give me some advice. i want to operate my harris rf 601 auto coupler from it automatically. is there an external connection which would do it ? there is an atu with it, so i thought that might have the right connection. all it needs is to ground the lead to the 601 whilst keying the tx.i will also have to get the proper plug. cheers, alan

Hi Alan,

Have had a couple of those Harris rigs myself, good choice. I have the ops manual on disk somewhere.

David,

Thanks for the reply.  I have the entire tank circuit with switch, the dual gear drive with turns counters (no knobs) and the plate vacuum variable.  They all came from Fair Radio back when they had truck loads of T368s.  I went up to Fair and picked out and bought a nice clean unit and then I bought enough spares to literally build another.  I sold all or at least I thought I had sold all of the stuff a few years back.  Anyway I found these few parts up in the attic.  Don't need them.  I'll take $125 plus shipping for all of it.  That is less then I gave Fair for the stuff.  Let me know.

# 3826. BC-610-E for sale

Yahoo group: T-368_BC-610
Date: 2009-04-07 18:34:26 UTC
From: Mikhael (Mike) Brown
Topic: 3826  Message: 3826

I have a BC-610-E for sale with the following:

BC-614 Speech Amp
BC-939 Tuner
JB-70 Junction Box (these are very hard to find)
all coils from 160 meters up
all Tuning Units from 160 meters up
KY-116 leg iron and T-50 mic
With all tubes
Original Manual

I located am in Oakhurst, Ca, 50 miles north of Fresno.

Selling it all as one package (asking $1600), PU only, unless you want to arrange packing and shipping.

Pictures available, will email them if you drop me a message.

Contact me offline:

From: Alan Morriss
Topic: 3827  Message: 3827

hello guys, it may be teaching my grandmother to suck eggs, but some of you might be interested in grinding the ft 171 xtals for the 610.
i have just put the 3570 one which roger kindly gave me spot on to 3577.
i recorded the data. using a sheet of 80 grade wet or dry paper wet on a sheet of plate glass.
moving in a figure of 8 it took 1 minute to shift it up 200 hz. this was using light finger pressure.
once this was established it was ground for 5 minutes at a time re assembling it and checking frequency at the end. when it was within 300 hz, it was ground for a minute and a half, and was spot on. cheers, alan g4gen

Holy Shit Mike?

But it might just be worth it.  I've been wanting one but that's way beyond what i could come up with.  Good luck and maybe we'll see you at MRCG.

I have a BC-610-E for sale with the following:

BC-614 Speech Amp

BC-939 Tuner

JB-70 Junction Box (these are very hard to find)

all coils from 160 meters up

all Tuning Units from 160 meters up

KY-116 leg iron and T-50 mic

With all tubes

Original Manual

I located am in Oakhurst, Ca, 50 miles north of Fresno.

Selling it all as one package (asking $1600), PU only, unless you want to arrange packing and shipping.

Pictures available, will email them if you drop me a message.

Contact me offline:

Mike, N6WIG

I wish that all of you people claiming to have a T-3 really did, instead of just being cutesy. Like referring to a T-47 as "an ART-13" and claiming falsely to have one. T-3/FRT apparently never went into production but one source indicates it was to have had push-pull 750TH's and an output of 6 KW. A T-368 or BC-610 might have barely served as an exciter. Maybe. I'd like to see a T-3. I once ran and worked on a TDH. Single 750TH. Interesting set (but only 3 KW). To perform weekly PMS you tagged out all the breakers, opened a door and walked into it. NAV-8 inherited one from 8-ND. AFAIK, I'm the last sailor who ever operated it.

I'm sure that W8QBG's T-368/URT is a nice unit, whichever of the six different models it actually is. But it is not a T-3 and neither are the dozens of others referred to over the past several years.

You're welcome.

I've been referred to more than once as a nomenclature nut. But the intelligent human mind is easily capable of differentiating between for example AN/ARC-5 and SCR-274-N and there is no excuse for pretending that they are the same things as except for the dynamotors and some of the connectors they were not. The people who lumped them together after the War were either just too young or just too stupid to serve.

Anyway, the tendency on this list for people to call a T-368 a T-3 has aggravated me for years. No one ever calls a BC-610 a B-6 so why should they call a T-368 a T-3? Especially as there was (briefly) a T-3 that had absolute ly nothing in common with the T-368 except that they were both HF radio transmitters. It's just cutesy laziness.

And again, absolutely nothing against the T-368-C that was offered for sale. Other than that it should have been described as a T-368-C.

And I'm going to bed.

No, but you often hear them referred to online, on air, and otherwise
as '610s' and no one seems to get confused or object. Many folks refer
to the Johnson Viking Kilowatt as the 'Desk Kilowatt' despite that not
being its correct nomenclature, yet everyone seems to know what it is.
Not saying it's right or accurate, mind you.

Especially as there was (briefly) a T-3 that had
> absolute

If the T-3 existed to the point of confusion, that'd be one thing. If
it really bothers you guys, you should be actively discouraging the
use of 'R-390 non-A'. Now there's a back-asswards term just screaming
to be dispelled. Following that mentality, you'd have to refer to all
previously-nomenclatured rigs as non-whatever, despite the fact that
they came first and are the only reason the later model exists. Like a
BC-610 non-B non-C non-D non-E, for example. Or the infamous KWM-2
non-A, SX-28 non-A, etc. Describing something by what it isn't. Now,
there's some new-age intellect for you.

The excuse has always been made that since the sets 'look a lot
alike', it's okay. Nevermind that the R-390 came first, the A was the
updated, cost-reduced model, and was given the 'A' designation to
indicate this. Used to be they were all called R-390s, which at least
is more accurate since there's no such thing as a 'non-A'.

The real downside is that it gets passed on to the newbs who come
along and hear it without knowing any better. At least they can do the
research online to find accurate information, if they so choose.

Maybe it's a secret type of LID filter? (o:

Has anyone listened to V/UHF recently? Especially on a popular repeater which seems to attract more people.

These days, with the Technician being the entry level license, you hear things like "KE5XYZ mobile and monitoring". Well, duh! What ELSE are you gonna be doing? If you just toss your call out there "W5OMR Mobile", then someone will -know- you're around, and if they desire, can call you. And nowadays, I hear the newbs say "KE5XYZ MONITORING!", with a little bit of 'attitude' tossed in as if to say "I'm -here-, damnit! SOMEONE Talk to me!" So, an old salt has pity, calls him up, and invariably listens to a minute or two of the station lamenting that 'no one ever comes back to my calls...' hey, dumb-ass! You didn't MAKE a call!

Oh, and lets not forget that the 'newb', now that he is 'in Que-so with ya' has to tell ya that their 'first personal is...' ~sigh~

How about these knuckle heads that break into the middle of an existing conversation between a couple of hams who are having an intelligent discussion about something particular, and some newb jumps in the middle, and says "KE5XYZ Monitoring" ... in the middle of someone's conversation ... and when it's turned to the breaking station, the newb then offers "Oh, I just wanted to wave a hand at ya, and let ya know I was listening!", contributing absolutely ZERO to the conversation.

My point is, probably the same as Todd's... if you wanna bitch about something, chose something worthwhile. Whether someone calls a T-368 a T-3, or a BC-610 a '610 is so minute, compared to the -real- problems that are out there in Radio Land.

I get aggravated, still, when someone says that 'to modulate a 100w carrier, you need 50w of modulator power'.
This is true, if we're modulating our carrier with a sine wave. We don't speak in sine waves. The human voice is a complex of vocal harmonics and frequencies that rise and fall far beyond what a plain ol' sine wave does. Couple that with the natural asymmetricalness of the typical male voice and it's easy to see that more AC voltage is required to faithfully reproduce our voice in the final amplifier stage.

so, hey! 3's and 8's and all dem good numbers atcha there, good buddy!
(hint hint, wink wink, nudge nudge... get it?)

You're welcome.

I've been referred to more than once as a nomenclature nut. But the intelligent human mind is easily capable of differentiating between for example AN/ARC-5 and SCR-274-N and there is no excuse for pretending that they are the same things as except for the dynamotors and some of the connectors they were not. The people who lumped them together after the War were either just too young or just too stupid to serve.

Anyway, the tendency on this list for people to call a T-368 a T-3 has aggravated me for years. No one ever calls a BC-610 a B-6 so why should they call a T-368 a T-3? Especially as there was (briefly) a T-3 that had absolute ly nothing in common with the T-368 except that they were both HF radio transmitters. It's just cutesy laziness.

And again, absolutely nothing against the T-368-C that was offered for sale. Other than that it should have been described as a T-368-C.

And I'm going to bed.

Many have things to offer, folks, and some of the
people that some of you have been taking swipes at
have offered a lot of substantive knowledge and
technical assistance to many of us over the years.

Improvements in the signal/ noise ratio are a good
thing; trying to get there by taking potshots at
others, or counter-pot-shots, even if you think
someone else took a potshot first, is unlikely to get
us there.

Remember, we are in an avocation ( an undertaking
based on a love of doing it ) ( which sometimes gets
people wound up ) and a service ( which is why we are
allowed to use the portions of the spectrum that we
are ).

In those famous words, "can't we all just get along?"

73- and let's remember what that means- best regards-

Trevor is right, George - the list really isn't the place for such behavior, Please take it offline. I didn't see anyone criticizing, simply stating their opinion on a topic about the T-368 and related equipment nomenclature. Robert Downs is one of the more helpful folks you'll find online, from knowledge to parts. As adults, we need to be able to respectfully agree to disagree on some items when it comes to the list, not whine about it. And if you can't do that, please take it to private email.

the connectors they

were not. The people who lumped them together after the War were either just

too young or just too stupid to serve.

Anyway, the tendency on this list for people to call a T-368 a T-3 has

aggravated me for years. No one ever calls a BC-610 a B-6 so why should they

call a T-368 a T-3? Especially as there was (briefly) a T-3 that had absolute

ly nothing in common with the T-368 except that they were both HF radio

transmitters. It's just cutesy laziness.

And again, absolutely nothing against the T-368-C that was offered for

sale. Other than that it should have been described as a T-368-C.

And I'm going to bed.

Hi George!  Geez, this people need to get a life!  We should all count our blessings just to be able to own, operate, or just discuss these fine old rigs.

As you can see, I signed up for the BC-610 and the T-3(68) reflector.  I was hoping to see some good buy and sells, and also some technical information.  I didn't realize that I would get instructions on RC (Radio Correctness) !

Take care, and see you on the air.  Art  KB7LOQ

Trevor is right, George - the list really isn't the place for such behavior, Please take it offline. I didn't see anyone criticizing, simply stating their opinion on a topic about the T-368 and related equipment nomenclature. Robert Downs is one of the more helpful folks you'll find online, from knowledge to parts. As adults, we need to be

able to respectfully agree to disagree on some items when it comes to the list, not whine about it. And if you can't do that, please take it to private email.

Hi:  We are headed up to Prescott early Saturday morning to take care of some shopping my wife has to complete at the mall up there.  She has $290 in cash coupons and needs to use them within a limited time window.  I will be on Sunday, however.

I've had this T-3 for almost two weeks, and with work and other things, it's been a slow process getting it on the air.  I did clear out an area in the radio room, and the empty chassis and the three drawers are now in the room.  I need to make up a power cord and have obtained the correct components.  Bill had it hardwired into the panel, and I need to put a three wire cord on it.  Also,I need to make up a stereo plugged g-stand for the microphone.  It is operational, but very dusty.  I will spend a little time cleaning it and de-oxing the contacts, lubing, etc.  The only known issue is that he had to run the speech amp wide open to fully modulate.  This was a change that happened some time ago.  I will check the tubes first and then see if other investigation is warranted.

I purchased an ME-165 military power/swr meter/600 watt dummy load from Fair Radio.  I did not have a sufficient dummy load for a bigger rig.  This was in fact as you probably kinow, designed for the T-3.  It came double-boxed, sealed in foil, and appears brand new, having been refurbished in 1981.  New paint, new connectors, etc.  I havn;t looked in the inside yet.

We are headed to Twin Falls, Idaho next Tuesday am to visit my second son, wife, and new grandkid.  Will return the following Sunday.

I want to get the radio on the air, but due to time limitations, will probably get her going after we return.  I am very impressed at the ease of teardown (except the ps weight!) and the ruggedness of design.  For someone who was running a Valiant all this time, all of a sudden I'm knee-deep in big rigs.  I guess that would make you neck deep!

Well, take care.  Nice seeing you here on this reflector.  I would presume you are the master tech and Elmer for all the rest of us on this group!  Art  KB7LOQ

The last 20 plus post have been nothing but whiney crap. Someone grow up. I have belonged to this group for about 8 years, but after I post I am DONE! This thanks to those that have made this group fun and informative. But those with the bad adittude's I won't miss. I get to many mails to sort the bull from the real mail. I still love my T-3's or 368's or what ever the hell you chose to call them. It's just a hobby. I don't take it serious like some do.

hi art glad you got the t-3 from bill ,i think that one was missing the back cover ,but it was strong the last i heard it on the air.i can handle the rf deck and the modulator deck with some help,but the power supply is another matter hi.i now use an engine hyd crane and lifting straps to move the power supply around. to work on.on the mic connection i use the carbon mic connector connected to a small bud box and use a blocking cap then feed the audio in with either a ampfilied d-104 or an amp sure 444 both work great the connectors can be gotten readily from fair radio or buy the mike and remove the connector.the other thing i use on one of the t-3`s is the 600 ohm from the rear of the rig this plug connector is also available from fair radio i also use an amp sure 444 or amp d-104 both work good.see u sunday on 160/75 meter am.if i can help let me know .have a good trip and dont spend all your money hi 73`s for now bro geo w8qbg.

You're welcome.

I've been referred to more than once as a nomenclature nut. But the
intelligent human mind is easily capable of differentiating between for example
AN/ARC-5 and SCR-274-N and there is no excuse for pretending that they are the
same things as except for the dynamotors and some of the connectors they
were not. The people who lumped them together after the War were either just

too young or just too stupid to serve.

Anyway, the tendency on this list for people to call a T-368 a T-3 has aggravated me for years. No one ever calls a BC-610 a B-6 so why should they call a T-368 a T-3? Especially as there was (briefly) a T-3 that had absolute ly nothing in common with the T-368 except that they were both HF radio transmitters. It's just cutesy laziness.

And again, absolutely nothing against the T-368-C that was offered for sale. Other than that it should have been described as a T-368-C.

And I'm going to bed.

Thanks for the advice, George.  Bill was running it with a plain D-104 into a stereo quarter-inch jack.  I will go with that for now, and maybe some time down the road get into some compression/limiter type stuff with a nicer mike.  I just want to fire her up and use her for a while.  Thanks for the offer, and I'm sure I'll be calling for advice.  I have my youngest son down the block and his friends nearbye to do the heavy lifting!  73's Art

hi art glad you got the t-3 from bill ,i think that one was missing the back cover ,but it was strong the last i heard it on the air.i can handle the rf deck and the modulator deck with some help,but the power supply is another matter hi.i now use an engine hyd crane and lifting straps to move the power supply around. to work on.on the mic connection i use the carbon mic connector connected to a small bud box and use a blocking cap then feed the audio in with either a ampfilied d-104 or an amp sure 444 both work great the connectors can be gotten readily from fair radio or buy the mike and remove the connector.the other thing i use on one of the t-3`s is the 600 ohm from the rear of the rig this plug connector is also available from fair radio i also use an amp sure 444 or amp d-104 both work good.see u sunday on 160/75 meter am.if i can help let me know .have a good trip and dont spend all your money hi 73`s for now bro geo w8qbg.

Hi:  We are headed up to Prescott early Saturday morning to take care of some shopping my wife has to complete at the mall up there.  She has $290 in cash coupons and needs to use them within a limited time window.  I will be on Sunday, however.

I've had this T-3 for almost two weeks, and with work and other things, it's been a slow process getting it on the air.  I did clear out an area in the radio room, and the empty chassis and the three drawers are now in the room.  I need to make up a power cord and have obtained the correct components.  Bill had it hardwired into the panel, and I need to put a three wire cord on it.  Also,I need to make up a stereo plugged g-stand for the microphone.  It is operational, but very dusty.  I will spend a little time cleaning it and de-oxing the contacts, lubing, etc.  The only known issue is that he had to run the speech amp wide open to fully modulate.  This was a change that happened some time ago.  I will check the tubes first and then see if other investigation is warranted.

I purchased an ME-165 military power/swr meter/600 watt dummy load from Fair Radio.  I did not have a sufficient dummy load for a bigger rig.  This was in fact as you probably kinow, designed for the T-3.  It came double-boxed, sealed in foil, and appears brand new, having been refurbished in 1981.  New paint, new connectors, etc.  I havn;t looked in the inside yet.

We are headed to Twin Falls, Idaho next Tuesday am to visit my second son, wife, and new grandkid.  Will return the following Sunday.

I want to get the radio on the air, but due to time limitations, will probably get her going after we return.  I am very impressed at the ease of teardown (except the ps weight!) and the ruggedness of design.  For someone who was running a Valiant all this time, all of a sudden I'm knee-deep in big rigs.  I guess that would make you neck deep!

Well, take care.  Nice seeing you here on this reflector.  I would presume you are the master tech and Elmer for all the rest of us on this group!  Art  KB7LOQ

The last 20 plus post have been nothing but whiney crap. Someone grow up. I have belonged to this group for about 8 years, but after I post I am DONE! This thanks to those that have made this group fun and informative. But those with the bad adittude's I won't miss. I get to many mails to sort the bull from the real mail. I still love my T-3's or 368's or what ever the hell you chose to call them. It's just a hobby. I don't take it serious like some do.

hello guys, i have been following the controversy about nomenclature of military gear with some puzzlement. it seems to me that it is a difference of opinion between an in group of ex operators and the rest. over this side it could not occur as so many of our radios had very similar numbers. all the raf communications stuff started with 11. thus the t 1154, r1155m t1115 r1116 etc. we would get in a bit of a pickle if we referred to any as the 11 ! that was an early army set, superceding the no 1.
i used to fly a really dreadful plane which we all referred to as a shed. we all knew what we meant, as it looked and flew like one, but others would be somewhat mystified. cheers, alan g4gen

From: Tom
Topic: 3863  Message: 3863

Or rather, so long and thanks for all the info over the years.

I'm not giving up because of the pedantry*** of the recent thread,
but because I sold my T-368 a few months back to a fairly pleasant
fellow, (k4kca) in Georgia.

For *decades* I wanted a T-368 and came close many times. Luck changed a few
years ago when one was for all intents and purposes, given to me. Other than
put some C connectors on some cable for jumpers and checking it for
completeness, that was all I did, and I felt it needed to go to someone who
would use it. It's all there, with no problems I could find via Simpson 269 - I
never powered it up while I had it, for various reasons, and it sat for many
years. Clarify - it sat in the living room for several years, PS and Mod drawers
sitting beside it, RF deck mounted in the cabinet. (My wife if quite forgiving,

The past few years on the list have been enjoyable, and thanks
to all who have kept it that way. Thanks even to the pedants,
as they've helped things by suggesting we be accurate - so then
the pedants my not be true pedants at all, Maybe these are folks
with common sense that hate to see information not being properly
presented. Robert fits into this category, I'd not call him a pedant,
I's call him someone with knowledge on the subject and the good
sense to speak up.

Best 73

Tom Norris NU4G

Footnotes -

** The subject line is in reference to a novel title writtenl by the
late Douglas Adams that is the last of the "Hitch-hiker's Guide
To The Galaxy" series. I highly recommend the entire series of
novels if you enjoy British Humour - the whole lot is a good read.

*** I'm not accusing any one specific person of being a pedant,
not even Robert Downs. Pots/Kettles, etc, I've done such as this
in the past, and may do so in the future, as my tongue and/or
keyboard can become autonomous in commenting over various
random issues that are dear or that I possess certain
knowledge - such subjects are very few so ye shouldn't worry
much heehee. Have fun, guys!!!]

Count me in with the nit pickers too, *despite* my previous post. In the case of the T-368(*), it's a simple battle between what has become a common term over the years against what should be an easy to remember nomenclature.

I suggest a time out - sit back relax, have a cup of tea or coffee or an ale, soda or ice cream, and repeat the phrase "This is only a hobby" until you've at least 3 servings of the above.

David,

Thanks for the reply.  I have the entire tank circuit with switch, the dual gear drive with turns counters (no knobs) and the plate vacuum variable.  They all came from Fair Radio back when they had truck loads of T368s.  I went up to Fair and picked out and bought a nice clean unit and then I bought enough spares to literally build another.  I sold all or at least I thought I had sold all of the stuff a few years back.  Anyway I found these few parts up in the attic.  Don't need them.  I'll take $125 plus shipping for all of it.  That is less then I gave Fair for the stuff.  Let me know.

Can anyone tell me what the heck the number is of the mating connector

is for the octal jack on the BC-614 that's labeled "TO JB-70"? I have

the cable and connectors to attach the 614 to the 610 and they are the

same but I need another one for the 614, I have searched high and low

and while I know its made by Amphenol I don't know the number and have

so far been unable to find one.

If anyone has one that they would be will to sell or trade (I have a

bunch of spare 610 parts) please contact me and we can work something

out.

From: wa5cab@cs.com
Topic: 3428  Message: 3872

Dave & Larry,

I don't think the Amphenol part number is in either the SCR-399 or the BC-610 manuals (any vintage) but in any case the connector that plugs into the BC-614 to go to the JB-70 is the same as the one on the end of the CD-764 that plugs into the BC-610 to go to the BC-614. Amphenol 79-08M. You'll find it (and the female and the chassis connectors) listed in Radio Masters of the 40's and early 50's. But not later. I have a few NOS @ $15.00 plus shipping.

However, if you have a JB-70, it should have a captive cable coming out of it with that connector on the end. If the key in the center is broken off, as it often is, you have to be damned careful plugging it in but it is still usable with care.

Yahoo group: T-368_BC-610
Date: 2009-05-22 03:50:40 UTC
From: Dave Trainor
Topic: 3428  Message: 3873

I'm not sure why this message got recycled WA5CAB had the connector and I purchased it from him. If someone else is wanting to find one too, Robert WA5CAB is the man, his price is very reasonable and it's the exact connector needed.

Thanks Again Robert - I have my chassis out getting metal cleaned and powder coated, should have on the air in a few weeks, (my goal is to have it completely reassembled and operational before fall) hope to hear and work you on 80!

Subject: Re: [T-368_BC-610] Connector "TO JB70"

Dave & Larry,

I don't think the Amphenol part number is in either the SCR-399 or the BC-610 manuals (any vintage) but in any case the connector that plugs into the
BC-614 to go to the JB-70 is the same as the one on the end of the CD-764
that plugs into the BC-610 to go to the BC-614. Amphenol 79-08M. You'll find
it (and the female and the chassis connectors) listed in Radio Masters of
the 40's and early 50's. But not later. I have a few NOS @ $15.00 plus shipping.

I have a running Vintage Military PE-197 WW2 Army Signal Corp. Gas Generator, 6.3Kva, 125V I was thinking of selling. This the generator that was used with the BC-610. It is currenly painted yellow and has provided power for my house during power outages during the winter.

If you are interested contact me off the list.

David,

Thanks for the reply.  I have the entire tank circuit with switch, the dual gear drive with turns counters (no knobs) and the plate vacuum variable.  They all came from Fair Radio back when they had truck loads of T368s.  I went up to Fair and picked out and bought a nice clean unit and then I bought enough spares to literally build another.  I sold all or at least I thought I had sold all of the stuff a few years back.  Anyway I found these few parts up in the attic.  Don't need them.  I'll take $125 plus shipping for all of it.  That is less then I gave Fair for the stuff.  Let me know.

Tim

Subject: BC-610 and 'ALL THAT" well 1066 maybe VK5WT

Hello James, it's Andrew VK5WT here, well an Aussie finally cracked the brain...We love Aussie sets down under here,

but my friend Rick has a fettish for American 6x6 s and I recently got him into collecting WW2 radios...and he 's going to join the ranks
of Ham Radio...

As a general outgoing letter I knocked it all together - not thrown together,, [?]

And due to my endless overlaod I missed your BC-610 on ebay [or the one on Ebay you mentioned on the web]

item no - 200344030668 SOLD US $1,000.00 , [how did i miss it? -[see abhove] ] Q.E.D.

right, well the story is - we're mad keen, I have an Aussie CMP 42 Chev Wireless Truck operational down here [gravity works here too]

Anyway...here's the Doc file, and the rundown, on our new adventure into 6x6 truck with BC-610....it's only a start, ..

The truck is done, and some of the gear is together ....so WHY am i writing to you ? well we're hoping that something good might happen,

one day... Rick has a Shipping container coming out of Michigan with some searchlights, etc, nearly with doors closing soon, and
oh how we mourn for a BC-610 . well at least you'll be able to mention that we're down here hoping to find one...we heard a rumour of a BC 610
in Australia here, but it's 4 or 5 years old ..a hard trail to follow... no name etc..the ususal story ..

I am a Broadcast Tech, with a greater interst in Ham radio than Broadcasting, now isn't that strange...
I can tell you that our AM stereo is all but gone here, and I mourn for good AM Stereo...at least 5Kw into a pair of masts...

I love the Canadian Nautel 1986 era transmitter... and I prefer WW2 gear at home on air..

anyway - I have a website..that is always lacking, and here's a copy of the Doc file...
Regards Andrew VK5WT

From: Mike Feher
Topic: 3877  Message: 3878

I re-painted my T-368F a little over 20 years ago. Fortunately, mine had a front panel where the labeling was relatively easy to fill in, so, I did not need to concern myself with any screens. It looked almost mint after I was finished. I also replaced all of the HV wiring, essentially re-building the whole unit. Additionally, I re-built my speech processor per the N9FOY suggestions which mimicked an early RCA design (except using two 2E26s). The way I re-built the speech processor/driver was to use the existing chassis, and the connector that was on it. However, I cut off the top of the chassis, built the processor on a piece of aluminum plate and also utilized the original connector. When completed, I aluminum soldered the new speech processor plate to the remaining chassis. This way, the new processor fits right in where it was before and the existing plug from the modulator deck connects directly to the re-mounted old plug with no additional modifications. So, the whole process is easily reversible with an original speech processor, should anyone ever prefer it that way after I no longer have it. The feedback resistors from the modulator tubes were attached to two Teflon strips about ¼ inch thick and mounted to the side of the processor chassis near the modulator tubes. It looked, and, worked great. Several years later I incorporated the modifications recommended by Tim, WA1HLR, but in my case, I did not notice any improvement. Probably more info than you wanted, but, that is what I did with mine, which by the way not only looked terrible when I obtained it but was far from working as well for numerous reasons. One of these years I hope to get back on the air again with it. 73 ☐ Mike

Actually,
If you want you can take a picture of the front panels, and
sides and back, in a size that is easily readable, take it/them
to an old tyme graphics designer, and have him make you
a set of silk screens and also quite possibly they will be
able to repaint them for you. The task is achieve-able
at any rate. The quality will vary depending on who
does the artwork for the screening. FWIW!

From: Keith Densmore
Topic: 3877  Message: 3885

I had a very bad front panel on the RF deck, so I removed it and sent it out for straightening (someone had beat it up with a chisel!) and paint and re-lettering (it was engraved).
The other two panels were in much better shape but stencilled not engraved. This I assume was due to mix 'n match at depot overhaul. So I masked off the lettering and re-sprayed the panels with a very close or exact match of paint color-- overall looks great, maybe not absolutely perfect, but mostly you look at the rf deck anyway.

There was a “registry” going at one time years ago. I don’t remember the keeper.

The manual TM11-809-35, TO31R2-2URT-134 dated December 1958 covers T-368/URT and A,B,C,D,E

The change notes issued 15 Oct ’59 show that the D model was still in contract in 1958.

That’s about where my documentation ends.

TX hr is T-368F/URT #103 ECCO Electronic Components.

Contract DAAB05-67-C0022

Subject: RE: [T-368_BC-610] T-368 Dates of Manufacture

There was a "registry" going at one time years ago. I don't remember the keeper.

The manual TM11-809-35, TO31R2-2URT-134 dated December 1958 covers T-368/URT and A,B,C,D,E

The change notes issued 15 Oct '59 show that the D model was still in contract in 1958.

That's about where my documentation ends.

TX hr is T-368F/URT #103 ECCO Electronic Components.

Contract DAAB05-67-C0022

Subject: RE: [T-368_BC-610] T-368 Dates of Manufacture

I recall seeing something once that gave at least a

relative chronology, but I can't recall where. But I

am pretty confident that I recall seeing somewhere

that the "F" model (which was the last variant), if

that's what you have, was likely the one produced in

smallest quantities and least frequently seen.

OK. Your transmitter was ordered in FY '67, which means between 01 July 1966 and 30 June 1967. But I don't have enough examples of Post Signal Corps order numbers to say whether it was early in the year (because of the 0022) or late in the year (because of the C).

For the record, whoever set up the registry made an error in the column headers. The one headed "Contract" should read "Order" at least through most of the production life of the T-368. Most T-368's were built before the destruction of the Signal Corps by the Pentomic Army Idiots in their return to late 18th Century organization. A Signal Corps Contract was non-specific as to equipment. In Civilian terms, it was a broad purchase agreement or contractor approval document. It basically said only that so and so was an approved contractor and authorized to bid on Signal Corp RFQ's, which might lead to Orders.

The equipment specific document was the Signal Corps Order. And the Order Number was of the format Sequential Number(beginning with 1)-Depot-Year. As in 14-CHI-42, the initial order for the BC-611 Handie-Talkie. This order was the 14th placed by the Chicago Signal Depot in FY 1942. It was placed during the first week of July, 1941 with Galvin Mfg Co. for production of the BC-611-A. In the mid 50's the abbreviation for the Philadelphia Signal Depot began to vary for no reason I have ever been able to determine. But the basic syntex continued until about 1962.

# 3895. PA Meter glass for BC-610-I

Yahoo group: T-368_BC-610
Date: 2009-07-23 15:21:29 UTC
From: n8zfm
Topic: 3895  Message: 3895

I have cracked my meter glass for the PA Plate meter, does anyone know of a source for a replacement glass? This is the outer glass for the meter. I have never seen a another meter with the convex curve to steal one from, and of course all I can get from the hardware store is a flat piece and I have no way to "curve" it.
Really depressed me last night when I noticed it. I had just replaced it after getting the ring refinished and maybe I tightened the screws too much, it was fine when I left it and then came back this morning to a nice crack all the way across. Most likely un-obtainium as the local 1943 parts store is out of business.

Dave -

I had the same problem, but I had another meter of the same style but different characteristics with the same curved glass. After a lot of work replacing one with the other, and reassembly and reinstallation into the transmitter, I found it cracked several days later. I don't think I over tightened it, either. Guess some trick is required to relieve the stress. The glass has a beveled edge and is held to the ring with solder flowed over the bevel. It's really difficult to replace.

I got very lucky and found a replacement on Ebay a few months later, but I still have my cracked-glass meter as a spare. If you figure something out, please let us know.

Which means there are 215 people that either have, had or want a BC-610
or T-368.

My homebrew rig combines the best of both worlds...

250TH's (push-pull, link couple) in the final,
250TH's in the modulator, with a T-368 Modulation transformer.

I included the original email but Yahoo stripped it off along with the link.

Here is a link to the guys collection - h t t p : / / w 2 d t c . c o m / 2 0 0 7 - 0 6 2 5 - n 4 f s - p a g e . h t m

and here is the text of his post: Sorry for the confusion!
**********
I am selling off the majority of my collection which includes 1000's of items. There are hundreds of radios of all kind. From the turn of the century to the Vietnam war. Here is a short list:

Military Radios - Transmitters/Receivers - Domestic & Foreign
Collectible radios - TRFs, Neutrodynes, Regenerative - Domestic & Foreign
Crystal Sets - Domestic and Foreign
10,000's of tubes of all sorts.
Ham radio items
Literature
Test Equipment
Parts
Etc.....

Some of these have some water damage and will require some TLC and all will be priced accordingly. There are some extremely rare items here. Extremely reasonable for items needing help. There is also a lot of equipment that does not have any water damage. All items will be priced to sell, or alternatively I will be open to offers.

So, come with a big truck and a big wad of cash and guaranteed you will be happy. The bigger your pile, the better the price. Please - no tire kickers, as I would only like to schedule people truly intending to buy and carry, some, or a lot, of items away. This would then help in scheduling the most interested people first. The dumpster is already here.

Call for an appointment as I can only have a few here at a time, so, scheduling will be necessary as stated above. I also do not want people fighting over items. First called first served as the saying goes. So far I am only putting the word out on various reflectors, but, eventually will advertise on Craigslist. If you call, and the answering machine answers, I will return call in the order received to arrange an appointment.

I will be available most days and evenings, but, weekends would be best.

Thanks & Looking forward to seeing you all. 73 - Mike

# 3907. Big Radio/Electroncs Sale

Yahoo group: T-368_BC-610
Date: 2009-08-21 10:49:00 UTC
From: Mike Feher
Topic: 3905  Message: 3907

PLEASE READ THE ENTIRE POST -

It seems a few people are getting the posts in digest form and have not seen the photos that represent about 10 % of what is here. As I will re-iterate below, not everything you see in the photos is for sale, but, most are.

Regardless, I have compiled my previous posts into one, and, you can find the link on the bottom of the page.

I am getting saturated by emails. I tried answering a few, but unfortunately

I cannot type as fast as I can talk, so, as I asked, please call. Phone

calls now are essentially free, it will help both of us. There is too much here to make a list, but, if you call I will try and accommodate specific requests as to whether I have certain items or not. Also, At this time I prefer not to ship. I would like to get rid of a lot of items at a relatively leisurely rate, at least for me. Some were here yesterday and that worked out great. The rest - below, are my initial posts combined into one.

I am selling off the majority of my collection which includes 1000's of

items. There are hundreds of radios of all kind. From the turn of the

century to the Vietnam war. Here is a short list:

Military Radios - Transmitters/Receivers - Domestic & Foreign

Collectible radios - TRFs, Neutrodynes, Regenerative - Domestic & Foreign

Crystal Sets - Domestic and Foreign

10,000's of tubes of all sorts.

Ham radio items

Literature

Test Equipment

Parts

Telegraph items

Very early "radio fax machine" as depicted in ARC a few years ago

Original National FBX with built in power supply.

Etc.....

Some of these have some water damage and will require some TLC and all will be priced accordingly. There are some extremely rare items here. Extremely reasonable for items needing help. There are also a lot of equipment that do not have any water damage. All items will be priced to sell, or alternatively I will be open to offers.

So, come with a big truck and a big wad of cash and guaranteed you will be happy. The bigger your pile, the better the price. Please - no tire kickers, as I would only like to schedule people truly intending to buy and carry, some, or a lot, of items away. This would then help in scheduling the most interested people first. The dumpster is already here.

Call for an appointment as I can only have a few here at a time, so, scheduling will be necessary as stated above. I also do not want people fighting over items. First called first served as the saying goes. So far I am only putting the word out on various reflectors, but, eventually will advertise on Craigslist. If you call, and the answering machine answers, I will return calls in the order received to arrange an appointment.

I will be available most days and evenings, but, weekends would be best.

For those of you who have never been here -here is a web page created by Ken (W2DTC), for me, that shows maybe about 10% of what is here, or what was here in some cases. Regardless it will give you a better idea.

http://w2dtc.com/2007-0625-n4fs-page.htm

Thanks & Looking forward to seeing you all. 73 - Mike

# 3908. Good Microphone for HT-4/BC-610 HT-5x Speech Amp

Yahoo group: T-368_BC-610
Date: 2009-08-23 01:54:29 UTC
From: bayonetdad
Topic: 3908  Message: 3908

Hi,

What would be a good microphone to use with the HT-4/BC-610 speech amp? Should I invest in something really good like a Heil high impedance mic?

If you have a recommendation would appreciate getting the maker and model number to purchase.

Many thanks.

VY 73,

Greg
K6SRO

# 3909. 100TH and 250TH advice and or comment

Yahoo group: T-368_BC-610
Date: 2009-08-25 16:06:59 UTC
From: rbethman
Topic: 3909  Message: 3909

Question:

I have noticed that the 100THs and 250THS that are in their original boxes, either not used at all, or maybe use for less than an hour to test them, seem to be doing fine.

Their envelopes are crystal clear an can not see any sort of defect.

Then the ones that are in one of the two BC-610s that has the hours on it, even though it last performed flawlessly, now appears to have gone gassy with some milky white inside the envelope.

Is this perhaps due to over heating or maybe I should phrase this as the convection cooling of these radios since they do NOT have fans.

Ideas? Comments?

It has always been metered and watched with a scope for observing waveforms, and the wattmeter is the newer Model Bird with peak reading built-in. (However true they really are!)

Bob - N0DGN

It may not do a lot of good but I built a rear TX cover and run fans
on mine. I never had new tubes for my tx but I really don't want to
replace the ones I have and so far have been lucky.

Tom,

The T-213 version, (Last model of them. Done in Depot in 1959), indeed
has a back panel.

I'm almost afraid to look in it!

The first one did fine for about two or three years. Then I had to
leave them alone as I nursed through rotator cuff surgery on one
shoulder, followed by significant repairs on the OTHER side.

Both of them were put on a "moving man" dolly right off the get go. The
wife has wall to wall carpeting over the bare concrete. So while
getting well, I really couldn't move them around.

I'm starting to think that a couple of muffin fans may be the route to go.

Someone offered to sell and ship me a back cover some years back. To be
honest, it was painted turquoise, had a low-pass filter bolted to it,
and was stored in a barn - and really showed it to!

That's why the first one never got a back panel!

There was a long and lengthy discussion regarding the big Transmitting tubes from Eimac, and lessons from Eittle-McCullough engineers on the proper operating of those big old Thoriated tungsten steel filament fire bottles.

Pretty much, they say that there's only a +/- 5% difference in voltage -at the filament pins) tolarence for proper operation and long life. Too low a voltage, according to them, is just as bad as having too much.

5V at 10.5amp is what the 250TH requires. If you're like me and have a dozen or so spares (none that are for sale for most -are- gassy and none of them have been fired up in 3 years) if you -do- want to chase the gas out of 'em, then run the filament voltage -up- to say, 6v for a day or so. AT least that's been the recommendations I get.

Check with Don/K4KYV. He's the knowledgeable expert on this subject.

Joe,

Don turns up on one of the horde of lists from time to time.

Although I'd PROBABLY do better lighting up the T-213 to talk to him!

Well, SURE, Don is on the internet. It was his input and transcribings
from the engineers at Eimac that led me to that suggestion.

4 or 5 years ago... the in AM Reflector. He's also on the AMFone.net site.

Do a google search for "k4kyv". Don is -everywhere- ;-)

(Operating your AM Rig without a scope, is like
Driving your car at night without headlights -k4kyv)

I wrote Heil Sound and received this reply from Bob Heil, so thought I'd share it here FWIW. I might give this configuration a try.

Greg/K6SRO
---
"HI Greg
Congratulations on your license. I know it was a struggle but so well worth it. Amateur radio has been my electronics college education and I have been extremely active since 1956.

I still have some of my early rigs and use them weekly if not daily. I am checked into the Vintage SSB net on 14.292 as I do each Sunday when here in our Illinois home (near St Louis). Today it was the C.E. 20a and 600L, Drake 2B receiver. Also have my 1962 HT 37, 1956 Harvey Wells TBS 50D along with the Harvey Wells T90 and 75A4. Several other good things in the vintage cabinet also.

Greg, here is what I suggest and what I use. You have various impedances along with various input sensitivity and gain with the older gear. I absolutely despise the D104. always have - my entire life. The stand an PTT is a joke. The sound is much TOO tinny (as you discovered). First, Spend 50 bucks or so for a Behringer UB 802 mixer, preamp,EQ and GREAT headphone amp when used for receive. I they use only of our PR r781 into this. The 781 and 802 gives you the ability to drive ANYTHING and make it sound as you want with it's three band EQ. I use one for receive also as most of the receive audio amps are not too good. I come straight out of the product detector and into one of the 802 inputs then drive a higher quality little 20 watt amps and a pair of JBL studio monitors.

http://www.heilsound.com/amateur/tips/behringer.htm

www.randl.com Roger has the Behringer and can help you with the cables perhaps as well as the Heil PR 781.

Let me know if I can help in any way. Hope to catch you on the air sometime soon with all of that WONDERFUL equipment!

BOB HEIL, K9EID

Of course he hates the D104. He wants to sell us his microphones! (grin!)

To be FAIR, Bob is a great guy who once donated a load of pre-amp
PC boards and other electronic goodies to my puclic school electronics
program in the mid-1970s when I met him at a hamfest. His products
truly are great and probably sound a lot more "hi-fi" than a D-104.

However, I have heard some great sounding AM stations using
a D104, especially those using a DX60 followed by a linear amplifier.
With a D104 on the DX60, you get tons of extra peak power, and
it's still real AM on the other end.

YMMV of course!

It certainly explains why some folks don't care for Bob's version of things.

As someone who has used the trusty D-104 crystal heads for decades, I couldn't disagree with him more. Far from being "tinny", the D-104 is actually what many refer to as being 'peaky', due to an emphasis on a specific group of frequencies. Looking at the response curve clearly shows this. They are not heavy on the lows, but certainly don't exclude them as a tinny mic would.

Gary Halverson did an article on audio for ER back in the early 90s IIRC. He used a crystal D-104 as his 'standard' to compare others to. At the end of the article he goes back to the D-104 and says "there's a reason it's been around for so many years". In production from the 30s through the early part of this century. Roughly 70 years, nothing to sneeze at. Can't believe they wold've sold so well and lasted so long if they'd sounded tinny.

Then again, a bad crystal element will tend to have a tinny, crappy sound. Maybe that's all that Bob Heil has been exposed to in his long career? I've yet to hear one of his mics that sounded good out of the box, without processing. While the D-104 won't sound great on every single transmitter, it at least sounds good on many.

It's kinda funny though, that Bob started copying the look of several older mics in recent years. Imitation is the sincerest form of flattery, right? Maybe he'll have a D-104 clone next?

Greg,

The HT-4 and BC-610 DO sound good with a D-104!

I also use a Shure 444 and a Shure 737A. They are all dynamic microphones.

The only thing I would give you a heads up on, don't use an amplified
mic. The speech amp has plenty of gain for a Hi-Z mic.

Even with the voltage brought down with a variac, you will have to watch
output to stay legal, not to mention the VERY real ability to over modulate.

Bob - N0DGN

Bob & Greg - good points.

I always found that the Shure 444 was a ood performer with
classic SSB rigs like the Drake TR4.

Greg,

The range of audio that the HT-4/BC-610 is built for is:

400cps to 3500cps. This is directly read from the first audio
transformer on the Modulation Deck.

If someone is looking for deep lows, the circuitry does not appear to
support this by what the components have for ratings.

These absolutely do not need equalizers, pre-amps, and all that other
"stuff". It would end up being money thrown down a rat-hole.

The speech amp has a built in limiter/clipper. Yes, you can adjust it,
but IF you do, follow the manual(s)!

From: rbethman
Topic: 3908  Message: 3923

To clarify!

The speech amplifier has a LIMITER *NOT a clipper!

The limiter does "compression" on over modulation peaks.

This is from page 18, Army TM 11-5054, USAF TO 16-40BC614-6, Titled,
"SPEECH AMPLIFIER BC-614-E,F,H,AND -I", DTD October 1952.

Page 3 gives the specification for the Speech Amp., regarding the
frequency response for a Dynamic microphone as 200cps to 3500cps.
Carbon microphone response is: 200cps to 2600cps.

Thanks for this group and your replies! Yeah, and Heil even has an HC-104 upgrade for the D-104. Anyone tried that one? It would save me a lot of money for stuff I don't need.

> As someone who has used the trusty D-104 crystal heads for decades, I couldn't disagree with him more.

> Gary Halverson did an article on audio for ER back in the early 90s IIRC. He used a crystal D-104 as his 'standard' to compare others to. At the end of the article he goes back to the D-104 and says "there's a reason it's been around for so many years".

Bob - N0DGN - good advice. Some hams been telling me I need a preamp.

> The only thing I would give you a heads up on, don't use an amplified mic. The speech amp has plenty of gain for a Hi-Z mic.

> Even with the voltage brought down with a variac, you will have to watch output to stay legal, not to mention the VERY real ability to over modulate

Overmodulation is something I am very sensitive about, thanks to a nice email from Gary Halverson. What a nice guy too, hope to visit him sometime next year and see his shack of shacks!

FB Greg -

Todd here, you got both Bob and I in your quote. Gary's article in ER opened my eyes to some very basic and easily overlooked principals of audio, and also set me on the path to tracking down a Collins 212A mixing console like the one he showed in his article. Have since gotten the 26W limiter, 116F equalizer, and 300G broadcast transmitter to go with it. Fun stuff.

Audio with the BC-610 or any other tube transmitter is only as complicated as you choose to make it. You can certainly add a lot o ancillary equipment to massage the audio, but more often than not you can plug in a mic and sound decent from the start.

Greg,

I am NOT involved in any commercial enterprise, and own only stock in outfits such as Boeing and Lockheed Martin. So anything dealing with Amateur Radio gets me nothing! (LOL)

Take a look at:
> I make a kit which uses the Kobitone element that is sold by Mouser. The "curves" on the microphone as well as a photo of the assembly can be found at
>

I believe the HC-104 also uses an external impedance matching transformer - AND - is intended "For amplified bases".

If you follow the instructions to keep plate current to 250mA on the PA meter, and ensure the modulation PEAKS on the speech amp do NOT exceed 200mA, you'll stay within limits.

Do your best to feed the "Beast" with no more than 117VAC. It "may" take the 125VAC that is being fed to pretty much everyone, BUT the Plate voltage WILL go beyond the 2000VDC that it IS intended for voice operation. I can tell you that these critters WILL get to levels WELL outside the legal limits for Amateur use. Even keeping the modulation clean, I've seen peaks easily over 2000W.

Your Mileage May Vary!

I have owned several D104 mics and I like them. Howver, I can tell you that, with no exceptions, the NON-amplified ones always sounded better for me with any transmitter, compare dto the amplified ones.

for high-Z input speech-amps (BC-610, T-368, Viking II, Ranger, 32-Vx's, etc..., the Hi-Z (1+Meg-ohm) D-104 is well suited. The input impedance is high, as is the D-104 impedance. A lot of people use either a 47k, or a 470k resistor in series with the audio line, or some .01 disc ceramic across the microphone output to ground.

For lower-Z input rigs (Drake, Swan, etc...) the D-104 will work, but sound tinny. The input impedance isn't as high, and these rigs are where that series resistance or capacitances are required.

At least, that's been my experience.

Solid state rigs need something -much- lower (under 5kohms, or so) so that's where dynamic mikes rule.

Not saying that this is how things are -everywhere-, but that's been my experience "in general".

hwllo everyone. there are 3 BC 610 s in this country and they all sound marvellous on air. i always got comments such as "it sounds like the bbc". i only used the standard dynamic mike. the carbon T 17 does not sound so good. right now mine is unservicable unfortunately, and until we can get it out of the shelter to work on, it will stay that way. cheers, alan g4gen

Subject: [T-368_BC-610] Re: Good Microphone for HT-4/BC-610 HT-5x Speech Amp

I wrote Heil Sound and received this reply from Bob Heil, so thought I'd share it here FWIW. I might give this configuration a try.

Greg/K6SRO
---
"HI Greg
Congratulations on your license. I know it was a struggle but so well worth it. Amateur radio has been my electronics college education and I have been extremely active since 1956.

I still have some of my early rigs and use them weekly if not daily. I am checked into the Vintage SSB net on 14.292 as I do each Sunday when here in our Illinois home (near St Louis). Today it was the C.E. 20a and 600L, Drake 2B receiver. Also have my 1962 HT 37, 1956 Harvey Wells TBS 50D along with the Harvey Wells T90 and 75A4. Several other good things in the vintage cabinet also.

Greg, here is what I suggest and what I use. You have various impedances along with various input sensitivity and gain with the older gear. I absolutely despise the D104. always have - my entire life. The stand an PTT is a joke. The sound is much TOO tinny (as you discovered). First, Spend 50 bucks or so for a Behringer UB 802 mixer, preamp,EQ and GREAT headphone amp when used for receive. I they use only of our PR r781 into this. The 781 and 802 gives you the ability to drive ANYTHING and make it sound as you want with it's three band EQ. I use one for receive also as most of the receive audio amps are not too good. I come straight out of the product detector and into one of the 802 inputs then drive a higher quality little 20 watt amps and a pair of JBL studio monitors.

http://www.heilsound.com/amateur/tips/behringer.htm

www.randl.com Roger has the Behringer and can help you with the cables perhaps as well as the Heil PR 781.

Let me know if I can help in any way. Hope to catch you on the air sometime
soon with all of that WONDERFUL equipment!

BOB HEIL, K9EID
www.heilsound.com "

My BC-610E sounds just great with its T-50 microphone, the one that it came with, no fancy bits and pieces, I will however try my Shure 55 just to see if it is better one day. The T-17 carbon mic makes it sound much more 'Mil comms' just for a bit of authentic fun. This is a really great radio to use, you can see it on my QRZ.com webpage. It is one of 3 working BC-610's in England at the moment, I have another 2 in bits awaiting parts especially meters.

Hi Alan,

Perhaps you would be able to inform those of us on this list with some of the history of the BC-610 in the U.K. if you know about it.

I never heard of the BC610 until I moved to the states, and saw and heard my first one in action at the station of AM operator Roger Frith, N4IBF (R.I.P.) - it had the side-benefit of being a great winter shack-warmer for his basement on cold days...

I know there are only a few over there in Great Britain, but I was told that one of them was famous for launching the broadcast singing and acting career of Diana Dors after WW2. Can you elaborate?

I heard that she became famous for singing on a 500 watt AM radio station that used a BC610 transmitter. Her success was such that, aged 20, she was the youngest registered owner of a Rolls Royce car.

Dors is included on The Beatles Sgt. Pepper's Lonely Hearts Club Band album cover art as the blonde in the front row on the right in the gold dress and white gloves.

hello bry, our BC610 is part of a complete scr 399 station on a gmc truck. we got it from holland, but it came originally from luxembourg. it was supposed to have been left there after the battle of the bulge, and given to them after the war. one of the others used to belong to me, and i saved it from being scrapped. the other two came from holland. there are a few others around in museums etc. i would be surprised if the one which transmitted diana dors is still around.
i also have a british w/s 53 which was introduced to replace the bc 610, and is greatly superior.
however, i just love operating the bc 610, and sitting in the shelter. if only it could tell me about the young guys who used to work in it. cheers, alan

# 3935. BC610s in the USSR

Yahoo group: T-368_BC-610
Date: 2009-09-04 16:34:41 UTC
From: g3vkm
Topic: 3908  Message: 3935

Hi All,

Slightly off the posted topic but the latest edition of the magazine of the Radio Amateurs Old Timers Association has a big article on Ernst Krenkel, who was famous in the old USSR for his bravery in keeping a radio link going from a drift-ice station in the Russian Arctic pre-WWII. He was a Hero of the Soviet Union and was allowed to use his old ship's callsign, RAEM, on the ham bands. There is a small museum dedicated to him in Russia and his post-war ham station of BC-610-E and AR-88 are both on display. The article shows Krenkel operating the '610 as well.

Cheers,

Roger/G3VKM - the bloke who got Alan's first '610-E!

I had the honor of having a QSO with Ernst Krenkel/RAEM (on CW of course) in the late 60's, and I have the QSL card signed by him. I told him then that I felt privileged having the QSO with him, as I read about his exploits when I was around 10 years old, and was so impressed, that I started to get interested in radio/electronics then!

Thanks Alan - I am not familiar with the WS 53. I will look into that one for sure!

I forget wgho it was that told me some years back that "DD" had started out early on in her career singing on broadcasts carried over a BC610. It just struck me as one of those amazing facts of "Bygone radio lore!"

hello bry, well, it may have been on the american forces network show. they may well have used bc 610s. the w/s 53 gives about 100w less than the bc 610, but it has an excellent and stable vfo covering 1.2 to 17,5 megs. the speech amp is internal and the audio quality is up to broadcast standards as it was intended to also be used as a temporary local broadcast station after the invasion. i have had mine for many years.cheers, alan

Hi Meir,

That's great, I never did hear him but used to see his callsign turn up in the DX reports in the ham magazines.

I think we forget how important these radio pioneers were in polar exploration. Nowadays, when some bloke walks across the top of the world he's got TV coverage all the way and the Internet to check the WX! Back in Krenkel's days it was hit or miss that the gear would work at all. The article I mentioned talks about having to strip the gear down before each use and dry it all, because the condensation in the tents they used then would cover all the HV points and everything would flash over.

By the way, there's a photo of Krenkel's BC-610-E on

http://www.rkk-museum.ru/news/news_e.shtml

and scroll down to 11th August 2005. A lot of other interesting stuff on that site too.

This is a very interesting story! So assume the audio on the receiving end must have been good enough to launch Diana's career. I haven't searched the internet yet for a photo of her in the studio with this BC-610, but if any of you chaps happen to come upon one or have one, would love to see it shared here, and perhaps see which microphone she was using.

Cheers!

Had a look at a few sites with photo collections but found nothing with DD and a '610. However, I did find the following anecdote, supposedly from the lady herself:-

"They asked me to change my name. I suppose they were afraid that if my real name Diana Fluck was in lights and one of the lights blew..." "

According to Dors' autobiography, she was once asked and readily agreed to open a fête in her home town of Swindon, England. Prior to the festivities, Dors lunched with the local vicar, during which she informed him that her real name was Diana Fluck. The vicar became somewhat worried about his planned speech. After lunch, they arrived at the fête at the appointed time. The vicar, totally unnerved about mispronouncing "Fluck", introduced Diana with these immortal words:
"
"Ladies and gentlemen, it is with great pleasure that I introduce to you our star guest. We all love her, especially as she is our local girl. I therefore feel it right to introduce her by her real name; Ladies and Gentlemen, please welcome the very lovely Miss Diana Clunt".

# 3943. BC-610 Problem - long description

Yahoo group: T-368_BC-610
Date: 2009-09-14 03:16:16 UTC
From: Dave Trainor
Topic: 3943  Message: 3943

Hi all, I am getting close to being able to put my restored 610 on the air but I have ran into a problem that so far have not completely diagnosed.

This is a 610-I model. I will be posting pictures but so far have just gotten it re-assembled and almost debugged...

Unit works fine in CW mode, although I kept output very low because I think the tubes probably have sat for years and want to give the filaments time to burn back in some. I have heard it's advisable to run them slightly over 5v for 24 hrs to allow getter action for any gas in the tube - anyone agree/disagree and how much over 5V - 5.1V or 6V?

My problem - switch to phone mode and the 6A fuse blows after 5-10sec and there is a humming noise from the (looking from the rear) left side of the mod deck before it goes. - I had a bad coil in RY3 that was creating the hum, replaced RY3, fuse now lasts 15 sec or so, hum not quite gone but greatly reduced. Fuse blows too fast to actually determine exactly where the hum is.

If I pull the bias rect V5 it runs just fine and the fuse stays healthy in Phone mode, so this fact is leading me to the bias section.

On the HV deck I had tge 2.5v fil transformer secondary open - also replaced, but the old one was not only open but was also shorted to ground, the potting appeared as new - so does the T1 transformer for the bias supply, its also supplying 2.5v for the 2A3's and 5V for V5 the bias rect - those voltages are fine, checked with v5 pulled and I have 500v+ on each half of the HV winding, (CT to End) My meter won't go over 800v so did not check the full winding. Pretty simple circuit here, both inductors have continuity, C20 and C21 are originals, they appear fine, when checked with an ohmmeter, R20, R34 and R11 are all within tolerance. Mod Bias rheostat is fine.

I replaced the wiring with new wiring in the complete transmitter, following the diagram in the manuals, the original cotton stuff had deteriorated badly, over the weekend I took the decks back out, retraced my wiring (not immune to mistakes at all) every wire is as it should be. Carbon Resistors and all the paper caps were just shotgunned, I kept all the mica's and big power resistors as they all checked 100%. I probably have destroyed collector value, but I have no desire to run a museum I want a transmitter that works as it did 60 years ago - reliably.

So - runs fine in CW mode - toggle phone - 4-5 sec FS4 (6A) blows - plate voltage in off position (bc-614 not connected). Also actually the FS5 (3A) blows in CW mode, but I put in a 6A fuse (since I had them) and that took care of that issue, but figure I should mention it in case it

adds info 9 I figured these caps have not had any voltage on them since before 1968 so might need a bit extra current at first.

Something wrong with the windings in T1 or maybe T3?? I am running out of 6A fuses and have not made more than guesswork on the issue.

I have spares for both transformers but the spares are untested and still in a complete enough second unit that is far too good to just part out, want to get one of them on the air and then think about the second one. With my time I can devote to this, I started last fall so I am being very slow and careful but also now getting so close I want to hear it on the air! I am located in Louisville, my dad's friend and the fellow who took all that time to teach me CW, fought in ww2 (he was a scr-299 operator in France) he had a 610 (I think it was an E) when I was just a kid, he did not use it because he said it was a sure fire TVI generator, but I still remember the awe and thinking what a transmitter - have wanted one for about 40yr now and its sooo close. I'm also thinking with Digital now the TVI issue is probably not a concern anymore, plus I am out a ways from the city.

Love to (I will) join you guys on 75m this winter.

Any idea's on how to determine if it's the transformer? I don't want to just start swapping parts due to ignorance J

Dave,

From your description it would appear that you're either shorting out or severely loading down your bias supply when you switch to the Phone mode.
With the transmitter off, hang an ohm meter across the output end of the bias supply and see what you get. From the schematic this should be around 3000 ohms to ground (R11 and R12 in series). Now close RY-3 with your finger and see what you get. Reading should drop a few hundred ohms but still be above 2K. If you see something significantly less than 2K ohms check the wiring between R34 and RY-3. Connecting the wrong end of R34 over to RY-3 would result in a 500 ohm or less load being shunted across the bias supply when RY-3 is energized. You mentioned that you had completely rewired your 610.

Thanks a lot Dennis, I will check that this evening. I did rewire, the manual is very complete on the wiring, if it had not had something eat the insulation off most of the wires on the HV and Mod decks I would have avoided that. I suspect that I did indeed make a mistake somewhere. Lacking the correct color coded wires I used tiny heat shrink and a label maker to mark each wire with the legend from the manual.

# 3947. RE: [T-368_BC-610] BC-610 Problem - long description

Yahoo group: T-368_BC-610
Date: 2009-09-15 03:33:24 UTC
From: Dave Trainor
Topic: 3943  Message: 3947

Found the issue - the wiring was correct but there was a short - I retained the original piece of braid shield for the grid leads to the 100th's and right next to T6 the shield ends and the 2 wires emerge to connect to T6 the braid is soldered with a small wire attached to ground - in soldering this wire to the outside of the braid it melted the insulation on both but one badly of the grid leads and they were shorted to ground. The braid was oxidized and I had to heat the heck out of it to solder, should really have checked that with the ohmmeter right after soldering, in retrospect it makes sense now.

Had to pull the deck out to get to it, actually pulled the deck earlier since R34 wiring was fine and ohmmeter checks were ok. I just fed 117V into T1 directly and started checking voltages.

So I need to slip a portion of some fiberglass braid over the grid leads to protect them from the heat while I solder the outside of the braid. My bias supply is now fixed.

Wonder what my next mistake will be? Completely rewiring I expected this..... At least at this point I have passed the smoke test now.

Want to thank Dennis again as it was great advise and pointed me in the right direction to find this one. I hope I am able someday to pass on advise as I gain more experience with the beast.

That's also really great advise Joe - I am old enough to respect 2000V+ but a lot of the new guys probably have never worked on a high power tube transmitter. Lethal if not only correct but if you get careless in tinkering with the plate power on. I got hit by a "little" HA 14 (pair 572's) about 15 yr ago and am lucky to still be here, was an experience never to forget.

Fuse blows too fast to actually determine exactly where the hum is.

If I pull the bias rect V5 it runs just fine and the fuse stays healthy in Phone mode, so this fact is leading me to the bias section.

On the HV deck I had tge 2.5v fil transformer secondary open - also replaced, but the old one was not only open but was also shorted to ground, the potting appeared as new - so does the T1 transformer for the bias supply, its also supplying 2.5v for the 2A3's and 5V for V5 the bias rect - those voltages are fine, checked with v5 pulled and I have 500v+ on each half of the HV winding, (CT to End) My meter won't go over 800v so did not check the full winding. Pretty simple circuit here, both inductors have continuity, C20 and C21 are originals, they appear fine, when checked with an ohmmeter, R20, R34 and R11 are all within tolerance. Mod Bias rheostat is fine.

I replaced the wiring with new wiring in the complete transmitter, following the diagram in the manuals, the original cotton stuff had deteriorated badly, over the weekend I took the decks back out, retraced my wiring (not immune to mistakes at all) every wire is as it should be. Carbon Resistors and all the paper caps were just shotgunned, I kept all the mica's and big power resistors as they all checked 100%. I probably have destroyed collector value, but I have no desire to run a museum I want a transmitter that works as it did 60 years ago - reliably.

So - runs fine in CW mode - toggle phone - 4-5 sec FS4 (6A) blows - plate voltage in off position (bc-614 not connected). Also actually the FS5 (3A) blows in CW mode, but I put in a 6A fuse (since I had them) and

that took care of that issue, but figure I should mention it in case it adds info 9 I figured these caps have not had any voltage on them since before 1968 so might need a bit extra current at first.

Something wrong with the windings in T1 or maybe T3?? I am running out of 6A fuses and have not made more than guesswork on the issue.

I have spares for both transformers but the spares are untested and still in a complete enough second unit that is far too good to just part out, want to get one of them on the air and then think about the second one. With my time I can devote to this, I started last fall so I am being very slow and careful but also now getting so close I want to hear it on the air! I am located in Louisville, my dad's friend and the fellow who took all that time to teach me CW, fought in ww2 (he was a scr-299 operator in France) he had a 610 (I think it was an E) when I was just a kid, he did not use it because he said it was a sure fire TVI generator, but I still remember the awe and thinking what a transmitter - have wanted one for about 40yr now and its sooo close. I'm also thinking with Digital now the TVI issue is probably not a concern anymore, plus I am out a ways from the city.

Love to (I will) join you guys on 75m this winter.

Any idea's on how to determine if it's the transformer? I don't want to just start swapping parts due to ignorance J

My first, and by far worst, near-electrocution event was courtesy of a BC-610-E 47 years ago. I won't go into the details. The moral of the story is never trust a bleeder resistor. 2600 volts hurts for quite a while, if you survive.

Dave,

OK, short it was but up on the 100TH grid leads. Lucky you didn't
take out the driver transformer. Hope the rest of the project goes
smoothly.

Dave,

Looking at the schematic again the short you found would not have loaded your bias supply down enough to blow the fuse by itself. With the grid short alone, the resistance the bias supply would see would have been something between 2200 and 2700 ohms depending on the adjustment of the bias control R12. This, of course, if the wiring is in accordance with the original schematic. The normal load on the supply (in Phone) is essentially R11 in parallel with R34 or around 2700 ohms with some small variation depending on the setting of R12. Grid short needs to be fixed, of course, but afraid the big problem has yet to be found.

Sorry :^(

hello, well, i made a stupid mistake when i first got the bc610. i had the ht switch on, having disabled the safety interlock. i forgot this and touched the tank coil. i nearly flew out of the shelter and the ht trip went. i have been working on big transmitters for at least 50 years ! fortunately i was always taught to keep one hand in your pocket. in many ways they are like a single engined aircraft. always waiting to get you . cheers, alan g4gen

Boy, I know what you mean. I blew both primary fuses on mine when I got on the high voltage. That's a lot of power to have to endure...
Very painful.

Topic: 3943  Message: 3954

You are right Dennis, still have a problem. Guess I will pull the mod deck yet again and retrace. I am becoming an expert and also building bicep strength with pulling it and putting it back J

This is not that complicated a circuit for me to be having this problem, but I must (do) have a mistake somewhere. The grid short was for sure a problem and that one at least is corrected now. I WILL get there eventually...

You know the one thing I did was follow the diagram for the "H" model because it was far more complete in the manual and had each wire easily marked. There are a couple of minor differences between the H and I, maybe I missed one that's critical here. I have been using the "I" schematic to trace things out, the only difference I have noted is R37 and a jumper on SW4 and I have both of those wired per the "I" schematic. I had not gotten this far but tried tonight just to see, turning on the exciter plate power is fine, voltages are correct and the VR tubes light up pretty purple, but turning on the plate power instantly blows the same 6A fuse. I have not completed the HV wiring to the RF deck, it ends at RY3, I have not wired in the plate meter yet either, so that is yet another - or maybe the same - mistake.

Re-creating all the wiring looms was not something I took on lightly but I had no choice, the rodents living in there at some point must have liked insulation.

It does at least look pretty now, I had all the metal dipped and etched and then powder coated. Copied all the labels and then had color transfers made to put back all the factory labels. Serial # 635 will live again.

Yep.  Same one.  I remember it from some time back as well.  Really nice radio but it's always been way overpriced.

Thing about listings like this are the wordings of "i don't know a thing about items like this"!  Then why did he pick it up at a hamfest a couple years back?  What did he think it was a tape recorder?  Then you see all sorts of electronic stuff in the background and it makes you wonder.  You see this in listings all the time.

One thing it does have though is the shock mount base plate.  And i do know that thing is heavy.  When at an estate sale about 6 years ago there were a couple of 610's setting out in the barn, almost complete but dirty and full of whatever there was floating around.  There was one of these 610 shock mounts there and i was dumb enough to leave it.  Dumb dumb!

Live and learn i guess.

Yeah, that is just a trifle steep (asking price). I would have cleaned the dust off the top, too. :-)

I have at least one of the shock mount pairs. The rubber has a tendency to separate. I think I have a second set that separated. Probably E6000 would put the pieces back together, but I'm not sure I would trust it in a vehicle.

I have a BC-610-E available. And a kit BC-610-F. By kit, I mean that the previous owner pulled the exterior sheet metal and had it repainted but never put it back together. I haven't had the time to do it either. Would be a nice looking rig if reassembled. I thought about keeping it, as my second 610 was an -F. But three years after acquiring it, I still haven't found time to put it back together. If anyone is interested in either, contact me direct. But you'll have to come get it, especially the -F.

I have been looking for a complete -modulator deck- for a 610-E for a
long time. I have a stripped chassis
but would need -all- the components to complete it. If anyone has an
extra I could sure use it. Thanks and 73

From: Trevor
Topic: 3966  Message: 3966

OK; I know that this is a T-368/ BC-610 group-

but-- y'all seem to now more than lots about some of this wonderful old iron-

a long time ago, I had a nice ART-13 that the prior owner had bought unused from Uncle Sam; between the pieces that I got from the prior owner (he was an SK and I bought it from his widow)(and I did not pay cheap) and my own scrounging, I fed it power from an AC supply that had extreme over-abundance of weight of power transformers, huge oil-filled caps, and chokes-

But--

Whether I tried to drive it with a carbon mic or a 40 watt Dyna monaural hi fi amp and pre-amp tied in; the primary of the ART-13's mod transformer or even tried hybrid -Heising coupling to the AERT-13's mond transformer, it would not modulate worth turd. tons of carrier- as in arc-scorch the plates out of the caps of a 'modern' antenna coupler-

Was I trying to drive a failed mod XFMR as a giant A.F. dummy load, or is there something else/ different that I should learn from this?

73

I take it that you no longer have the T-47. It is possible that the 813 plate secondary of the transformer was shorted. But I've had quite a few of the sets and historically the only bad modulation transformers I have ever seen had been removed from a transmitter and then dropped. If you had weak modulation (not no modulation), one possibility is that the contacts on relay K103 that are across the plate winding were welded. And all that you were modulating was the 813 screen. Although I don't recall ever seeing it, this might happen if you switched from Voice to CW with key down and while whistling into the microphone. Or the relay could have been stuck in the CW position. How did you remove the 1250 VDC from the 811 plate leads when you hooked up the Dyna to the transformer?

T-47's normally have pretty good audio. When I left for Vietnam in 1967, one of mine was TAD to the LA Tech campus radio station operating on 770 KC. So for that matter was my BC-610-F.

I agree - if he doesn't KNOW anything about it, then that absolves
him of any responsibility, right?

How strange that he "KNOWS" enough about it that he wants
$3,000.00 for it!!

# 3970. RE: [T-368_BC-610] BC-610 Problem - long description

Well I went back to the drawing board and printed out a 3' by 2' poster of the schematic and have been tracing each wire. So far I have verified my front panel, the power supply deck and the interconnecting cables. Up to this point I have not found an error. I have been traveling a lot the past two weeks for work and have not gotten any farther yet. I am certain that I must have made a mistake somewhere altough its possible that the center tap on the 2.5 volt winding of T1 may be bad. It could be what's loading down the bias supply but before I disassembled things an Ohmmeter did not reveal any issue. Do you know of a way to verify that?

If you click the link below, it will error saying file not found, but in reality, it is there in the Files Section. Just go to Files and scroll down. You'll find it. Enjoy.

As soon as BAMA comes back online, I will upload the HiDef version which is 22 MB in file size. Yahoo limit is 5MB.

# 3974. Was- New file uploaded to T-368_BC-610

Yahoo group: T-368_BC-610
Date: 2009-10-04 03:31:46 UTC
From: Trevor
Topic: 3974  Message: 3974

While we are focused on history from that era, I finally found a partial reference to the really interesting bit I found on the role of the BC-221/ LM etc family of frequency meters to the Allies victory in WWII-- and the development of some of the very early vacuum tube/ mechanical computers to make the calibration books

http://jproc.ca/ve3fab/bc221.html

I have tried to search online for the print article described in that web page as:

"in-depth article about this system (the frequency meters) including photos, partial schematics, integration formulae and much more can be found in the magazine 'Electronics' for May, 1944 at page 98."

and have not found it. I do not know of any place that has archives for "Electronics" and don't know if that magazine has any "surviving successors" that I could contact.

Anyone have any leads on a non-time-consuming way to find the original 1944 article?

I know that this is a bit off topic from T-368s and BC-610s, but I am assuming that the freq. meters may have had a role in the whole overall "set" that the 610s were a part of?

Thanks & 73
Trevor

Glad you brought up the BC-221. Without calibration equipment, the rest of the hardware does not perform in optimal fashion.

I checked the ARRL archives (members only) and there are 22 articles catalogued there. Unfortunately, not the one you are seeking but nonetheless, a wealth of information and applications for it. Thank you for posting as I hadn't thought of checking ARRL for BC221 info before. Now I will restore mine for sure!

I got a 221 with my 610, Other than checking all the tubes and replacing the electrolytic caps in the added power supply it powered up and worked fine. I checked the supplied calibration against a tek counter and found it to still be within a couple hundred Hz of the original calibration. The accuracy is astounding after 65 years, a very well designed piece of equipment.

# 3977. RE: [T-368_BC-610] BC-610 Problem - long description

Yahoo group: T-368_BC-610
Date: 2009-10-05 01:16:08 UTC
From: Dave Trainor
Topic: 3943  Message: 3977

Dennis,

Super news, I found the problem. It was a silly mistake
and could only be made by following the numbered wiring diagram in the
TM 11-826 manual - figure 94 - I had gotten wire 260 and 261 reversed, I
gpt my little heat shrink markers backwards on the wires. So I had 117V
on one of the Bias rect plates and worse, the correct bias end on term 2
of T1. (basically reverse connections on term 2 and 5 of T1) A wonder I
did not do some type of damage and that's a credit to the designers for
choosing components that are built to go thru a war.

So I now have all of my voltages correct including plate voltage. Now I
can finish up some RF deck output wiring and move right into testing. I
have heard it's a good idea to let the 100th's and 250th sit with just
filament voltage for several hours, mine have not seen any use in at
least 20 and maybe 30 or more years.

Going to be away again all this week so I have to get back to it next
weekend, but have been smiling since I found my problem. I have not
started reassembly of my 614 so soon as I conduct a successful CW test
with the 610, that is my next step.

73 - Dave N8ZFM

# 3978. frequency and calibration items to go with BC-etcs

Yahoo group: T-368_BC-610
Date: 2009-10-05 02:15:11 UTC
From: Trevor
Topic: 3978  Message: 3978

Yeah- thanks- I have looked at some of those by way of old paper QSTs that I have an incomplete, but sometimes accidentally topic-matching batch of, and by way of some of the CD/DVDs of back issues. Also have seen a CQ article or two on the BC/LM series. Often as not, they are in some way about modifying them- which made sense at the time given that so many, especially those lacking unit-matched calibration books were going for cheap or ending up in the garbage. I still REALLY want to get ahold of the 1944 article, as it, from anything that I can find, is much more about how these items that many take for granted, or some thought of as obsolete relics, actually represent something that was pioneering physical invention and development of early computing technologies- and also is tied up in some huge regards with the outcome of the struggles against fascism in the 1940s- if you couldn't accurately aim for a frequency and be sure to get there, you were less likely to get a message through- and the Allies, with the BC/LM, apparently had a big advantage in getting on the right frequency. Sort of marvellous to me, given the technological limits of the time, compared to modern digital technology (useful as it is) where it is sort of easier to use, yet in some senses less remarkable (given the context) and also less robust under severe conditions.

still on the search for the '44 article- I will look some, ask a reference librarian locally, and hope others keep looking, too.

73
Trevor

Glad you brought up the BC-221.
Without calibration equipment, the rest of the hardware does not perform in optimal fashion.

I checked the ARRL archives (members only) and there are 22 articles catalogued there. Unfortunately, not the one you are seeking but nonetheless, a wealth of information and applications for it. Thank you for posting as I hadn't thought of checking ARRL for BC221 info before. Now I will restore mine for sure!

# 3980. Re: bc221

Yahoo group: T-368_BC-610
Date: 2009-10-05 08:10:03 UTC
From: Alan Morriss
Topic: 3980  Message: 3980

hello guys, i have two bc221s, one with a metal case which came with the scr399 station and the other with a woodenj case. that was my first one, and i had it overhauled by someone who specialised in them some years ago. the wooden cases are more stable as they maintain a constant temperature better.
i use it regularly. and am constantly amazed at how good it is.the accuracy is equivalent to a 7 digit frequency meter. for some reason, they never fetch much money.
they are in effect a laboratory instrument, yet they were rugged enough to be used in the field by soldiers ! cheers, alan g4gen

hello bill, i use mine when it is servicable with no problems. once you have done any mods you have destroyed much of the value it has as piece of history.
remember, it was one of the things which won the war. there are not many pieces of wartime equipment which can be used for their original purpose today.
i bet you get a lot of fun operating a bc 610 again ! ccheers, alan g4gen

Hi Alan:
I totally agree with you. However, if my memory serves me right, many years ago when I had the E model, (1955-57) there were several problems starting with the speech amp. The beast was great for TVI and the procedure those day's was to shield the amplifier and filter all leads. I always thought why not go after the offending circuit and suppress the parasites' Guess shielding and filtering was much easier back then. Then there was something with the modulation transformer and feeding the audio through a splatter suppressor (positive peak clipper). Putting the HV chokes in the negative lead. etc. I used an outside source of RF excitation into the TU. Crud, but the ole HT-18 did a better job and was much more stable. The ole gal hit the surplus market 65 years ago and considering the advancements in the electronics field I thought there would be numerous upgrades purposed by present and past gurus'. Meanwhile, I thought it best to ask a few questions on "what's the latest" with the ole gal before I tote one into the garage (shop) for a possible rebuild. Just missed a rebuilt I model in my local area a year ago but my mind wasn't in the fast mode and she found a home elsewhere. Stay tuned.
Cheers
BillHarris/w7kxb

Hi Alan:
I totally agree with you. However, if my memory serves me right, many years ago when I had the E model, (1955-57) there were several problems starting with the speech amp. The beast was great for TVI and the procedure those day's was to shield the amplifier and filter all leads. I always thought why not go after the offending circuit and suppress the parasites' Guess shielding and filtering was much easier back then. Then there was something with the modulation transformer and feeding the audio through a splatter suppressor (positive peak clipper). Putting the HV chokes in the negative lead. etc. I used an outside source of RF excitation into the TU. Crud, but the ole HT-18 did a better job and was much more stable. The ole gal hit the surplus market 65 years ago and considering the advancements in the electronics field I thought there would be numerous upgrades purposed by present and past gurus'. Meanwhile, I thought it best to ask a few questions on "what's the latest" with the ole gal before I tote one into the garage (shop) for a possible rebuild. Just missed a rebuilt I model in my local area a year ago but my mind wasn't in the fast mode and she found a home elsewhere. Stay tuned.
Cheers

hello bill, i use mine when it is servicable with no problems. once you have done any mods you have destroyed much of the value it has as piece of history.
remember, it was one of the things which won the war. there are not many pieces of wartime equipment which can be used for their original purpose today.
i bet you get a lot of fun operating a bc 610 again ! ccheers, alan g4gen

Subject: [T-368_BC-610] BC610 mod's.

Has anyone compiled a list of mod's for the 610 series? I'm about to re-enter then market again for a 610 and was thinking of various mod's one could make to bring the ole gal into the 22nd century (what ever that means)
Regards

BillHarris/w7kxb

Bill,

An almost complete TVI removal can be accomplishes by using an external Low Pass Filter attached directly to the BC-610 output.

The remainder can be removed by monitoring the modulation by a scope.

The BEASTS will over modulate in a heartbeat!

In lieu of a clipper, properly adjust the audio limiter in the speech amp, and adjust the mic gain to read the correct audio peaks on the meter in the speech amp.

I've operated this way for years, and have NO TVI or splatter issues.

The BEASTS are very well engineered and designed. We find that the majority of issues come from improper operation and adjustment.

hello, i found that if the modulator plate current is set correctly at 40 ma , using the dynamic mike there was no problem with over modulation. it all went very well, and reports were of having bbc quality. cheers, alan g4gen

Alan,

Going through the TM, That is an "initial" setting.

Depending upon voice characteristics and microphones, this setting "may"
need to be changed.

It should be watched for peaks that "may" exceed the 40mA.

Then adjust as needed.

That is another reason to monitor with a scope in the output.

I happen to use a Kenwood SM-220 with BP-8 Panadaptor.

I can see precisely what the carrier AND the sidebands are doing.

I found I have had to exhibit a bit more control!

Alan - Hope you can get it repaired soon. I know the shelter does not provide much room! (LOL)

I feed the audio directly from a Shure 737A. It is a "true" crystal microphone.

It is interesting in itself. There is a diaphram that is attached to a lever that is secured to a plated quartz crystal that is anchored on the opposite end.

It uses the piezo-electric effect/method to create the output.

I connect this mic to the dynamic mic segment of the speech amp.

I've used two different 737As in my ham years. I've initially used one connected to a Hallicrafters HT-37.

hi bob, well, i thought that the impedance would not match. i like crystal mikes, and used d104 for some time. i have a harris rf 3200 as my ssb rig, and that uses a shure 527c. i wonder if a 737a would work better. cheers, alan

Alan, It matches very well. So does the Shure-55!

They sound great too!

Bob

Bill Harris,

My gawd, it's been years since we've talked.  Amongst the last times were on 40M AM and that's been  what, 10-15 or so years back.

Anyway it's good that you came out of the closet.  Don't know where you are but Robert Downs in the Houston area has a couple of 610's one of which i was going after if i had to go over that way next week.  But things change and i don't have to make that trip so they are available if your in that area.

Don't know what may show up around the west coast.  good luck on the hunt and they are indeed a grad ol' lady.  I've had 4 of them go thru here and failed to keep any of them, one an E and a couple of I models.  One came from Tucson which was really nice.  Should never have let them slip thru my fingers.  Oh well.

Hi Alan:

I totally agree with you. However, if my memory serves me right, many years ago when I had the E model, (1955-57) there were several problems starting with the speech amp. The beast was great for TVI and the procedure those day's was to shield the amplifier and filter all leads. I always thought why not go after the offending circuit and suppress the parasites' Guess shielding and filtering was much easier back then. Then there was something with the modulation transformer and feeding the audio through a splatter suppressor (positive peak clipper). Putting the HV chokes in the negative lead. etc. I used an outside source of RF excitation into the TU. Crud, but the ole HT-18 did a better job and was much more stable.

The ole gal hit the surplus market 65 years ago and considering the advancements in the electronics field I thought there would be numerous upgrades purposed by present and past gurus'. Meanwhile, I thought it best to ask a few questions on "what's the latest" with the ole gal before I tote one into the garage (shop) for a possible rebuild. Just missed a rebuilt I model in my local area a year ago but my mind wasn't in the fast mode and she found a home elsewhere. Stay tuned.

Cheers

BillHarris/w7kxb

hello bill, i use mine when it is servicable with no problems. once you have done any mods you have destroyed much of the value it has as piece of history.

remember, it was one of the things which won the war. there are not many pieces of wartime equipment which can be used for their original purpose today.

i bet you get a lot of fun operating a bc 610 again ! ccheers, alan g4gen

Has anyone compiled a list of mod's for the 610 series? I'm about to re-enter then market again for a 610 and was thinking of various mod's one could make to bring the ole gal into the 22nd century (what ever that means)

Regards

BillHarris/w7kxb

I'm here in the Seattle area during the summer and return to Mesa, AZ during the winter. Don't know if you know DX-George Portell in Mesa??? W8QBG I believe. Anyway, I handed off to him, for hauling away, a couple of 610's and 368's a couple of years ago. I believe George got them back on the air so they found a good home. Now that I have settled back into the Seattle area, I'm looking around for one of the ole gal's. .Have you heard from w6pss lately. Understand Dave is now living near Kansas City, KS. and I believe he has a BC375/191 on the air.

>

Dave, this thread came up on the AM Reflector a number of years ago.
Don/K4KYV in Woodlawn, TN spoke with some Eimac engineers at length on
the subject.

I don't remember *exactly* what the outcome was, but I -do- remember the
statement being made that running too much voltage AS WELL AS too little
voltage is equally hard on the tubes, -while in transmit-. I think the
variance given was somewhere in the neighborhood of +/- 10%. Therefore,
250TH's and 100TH's should never be run more than 5.5v or less than 4.5v.

Some hams say they can get longer life out of a tube by running it at
lower voltage, or down to the point where the tube starts to loose
emission, and then bump it back up so there's no sag. According to
Eimac, that's -not- a good idea.

As for 'burning in' the tubes, without B+ (disconnect the plate leads
from the rectifiers) turn the Beastly 610 on and let it set, with tubes
burning, for -at least- 24 hours, preferably 48, maybe even 72 hours at
5.5 or 5.75v to perform the re-heating of the seal, activating the
ghetter and keeping the triode from looking like a Mercury Vapor
rectifier. Ask me how I know how the result of no patience looks.

Even still, you're not guaranteed good results. MAYBE, if the tubes
were properly stored, and MAYBE, if they were stored vertically
(filament didn't sag toward the grid) the tube will be good and work
after a 2 or 3 days of burn-in. DO NOT GIVE INTO TEMPTATION! You will
-for sure- wind up with 'gassy' tubes. Doing everything else is a 50-50
shot of having something that will work.

Time to start mining unobtanium and finding some replacement tubes.

I spoke with Deacon Dave not too long ago (a few days.. week maybe) and he is indeed in the KC area. I do -not- believe he's running any boat-anchor equipment.

Story from him was, he was hauling a BC-610 back to Chula Vista when the beast shifted in the trailer, causing the back of his vehicle to 'jerk', causing the steering to be 'jerked', causing the 610 to tump over in the trailer.

Looking back in the chat log, it shows we "talked" (in AOL Instant Messenger) on 04 OCtober 2009, from 21:08CST till 21:18CST

He is indeed in KC and looking to put a station back on the air with, possibly, the help of Ted/KC3OL.

Session Start (w5omr:w6pss): Sun Oct 04 20:57:16 2009
[Sunday 04 October 20:57:17] w6pss: its me jeff, david gohead!
[Sunday 04 October 20:57:36] w5omr: how's things in KC, Deacon Dave?
[Sunday 04 October 20:58:21] w5omr: you are in the mid west now, right? (over)
[Sunday 04 October 21:00:42] w6pss: ine Babe, me hanging in best considering health. God is sustaining us. Trying to get antenna up now that approval granted. Need to dig trench for cable then await tuner for open wire feed. Also, must install masts. So, be while yet. Then wh can get together and create more or expand on old stories with a little flair doncha know. Yes, we be in KCV about 2 miles outside city limits on small plot of ground - enuf for 40m double extended zepp.

I know George quite well.  Wondered where he had found all the 610's and 368's as i hadn't heard of any being available.  Hmmmmm.  I think he's sold a couple of them already, to pricey for me though.  should have kept the one's i had that cost me $200 or nothing.  Live and learn.

I've not heard anything about David, w6pss.  Well i might have heard the other day somewhere that he was on 14,276 the W6HQI 20 meter freq.  My memory is fading a bit so that may not be correct.  Otherwise, no i haven't heard anything about him for some time.  Didn't know he had left the west coast.

I have been hanging around working DX on HF and 6 meter SSB/CW with my new Elecraft K3.  Sure a nice radio.

AM wise i have the TMC SBT-1K out in the garage that i HAVE to get around to doing a couple of things with it so i can use it this winter and the PAL-500 amp arrangement her ein the Shack, also by TMC and the good ol' Viking II that is sawaiting a 25K 20W resistor to replace the one under the chassis that opened up on me.

Look for you when you get back.  Snowbirds on their way so you might just as well come on down also!!

Hello Gents:

I have a BC-610 Modulation Transformer For Sale. It is a Stancor 55C028.
It is in very good condx. No rust, and no corrosion. Insulators are
excellent. Tested Good.
Contact me at _pjpilot@..._ (mailto:pjpilot@...) for further
information.

# 4002. RE: [T-368_BC-610] BC-610 Problem - long description

Yahoo group: T-368_BC-610
Date: 2009-10-22 22:54:48 UTC
From: Dave Trainor
Topic: 3943 Message: 4002

Geoff, that was good advice and I got lucky too, I let them cook at 5.75v for 72 hours, reduced it to 5.0v and followed the tune up procedure for CW. I only loaded the PA to 250ma, I briefly had it at 290ma but the plate grew a fairly bright red, at 250 the plate glows a dim dull cherry and I get enough power to get the dummy load hot. I have to go disconnect my power meter to get a real reading but by the heat generated it looks to be putting out a good many watts. I had it set somewhere on the high end of 80M, I used the MO in the tuning unit so you understand the somewhere.

Not having much (any) experience with the 250TH, just how much red glow from the plate is too much?

I do have 2 spare ones, but all I know about them is that the filaments are good.

Now I have to finish the 614.

73 - Dave N8ZFM

From: T-368_BC-610@yahoogroups.com [mailto:T-368_BC-610@yahoogroups.com] On Behalf Of Geoff/W5OMR

Subject: Re: [T-368_BC-610] BC-610 Problem - long description

<snip>

As for 'burning in' the tubes, without B+ (disconnect the plate leads from the rectifiers) turn the Beastly 610 on and let it set, with tubes burning, for -at least- 24 hours, preferably 48, maybe even 72 hours at 5.5 or 5.75v to perform the re-heating of the seal, activating the ghetter and keeping the triode from looking like a Mercury Vapor rectifier. Ask me how I know how the result of no patience looks.

Even still, you're not guaranteed good results. MAYBE, if the tubes were properly stored, and MAYBE, if they were stored vertically (filament didn't sag toward the grid) the tube will be good and work after a 2 or 3 days of burn-in. DO NOT GIVE INTO TEMPTATION! You will -for sure- wind up with 'gassy' tubes. Doing everything else is a 50-50 shot of having something that will work.

Time to start mining unobtanium and finding some replacement tubes.

;-) yeah, I know the 'somewhere' ;-) don't be tempted.. make sure the interlocks are functioning. If you have to adjust the link (if your coil has one) make sure the B+ is off of that circuit, and bled-down first! Even then, it would be a good idea to have a grounding stick attached to the ground on the beastly 610 and make sure that thing is hooked onto something while you're inside the tank circuit.

>
> Not having much (any) experience with the 250TH, just how much red glow

Typical values on the 250TH tube, in Class C, RF Power Amplifier and Oscillator are

Max. Rating
DC Plate Volage . . . . . 2000 3000
4000 4000 Volts
DC Plate Current. . . . . 357 333
313 350 mA
DC Grid current . . . . . 94 90
93 100 mA
DC Grid Voltage . . . . . -100 -150
-220 Volts
Plate Power Output. . . . . 464 750 1000
Watts
Plate Input . . . . . 714 1000
1250 Watts
Plate Dissipation . . . . . 250 250
250 250 Watts
Peak RF Grid Input Voltage (approx) . . . . . 345 395
470 volts

Driving Power (approx). . . . . 29 32
39 watts

(* The above figures show actual measured tube performance and do not
allow for variations in circuit losses.)

Advice still follows... cook 'em in like the last ones.

> Now I have to finish the 614.

Do yourself a favor and go ahead and gut the 'stock' BC-610 audio in the
614 -or- leave it stock and put in a switch to something a little more
'pleasing' for Amateur use. It won't take much to make that beast sound
-decades- better than the carbon-button design from the '40's.

I had a 614 with my '610-E... also had a home-brew rig using a pair of
250TH's in the modulator (and a pair in the final). I was also using an
old modified Bogen PA system, with a solid-state audio driver circuit
dreamed up by John/WA5BXO. In an emitter-follower configuration, the
emitter outputs out of a pair of horizontal output transistors (high
voltage, hi Beta) through some 25k 25w resistors feed the grids of the
Class B modulator tubes directly. In order to use this on the 610, I
just had to remove the grid leads off of the 100TH's, and replace them
with the leads from the solid-state audio driver, and (of course) make
sure it was grounded to the transmitter. The difference between the 614
and the solid-state driver w/Bogen pa system was the difference between
listening to a record on a megaphone (all scratchy and distorted) to
listening to some FM Station. No mods to the '610... just a different
source of audio.

The plans for the slid state driver (should you so desire) are at:
http://www.qsl.net/wa5bxo/driver1.html

You know, Dave... I just realized that this still didn't answer your question...

How much redness is on the plate of a tube, depends on the tube. There's several kinds out there. EiMac, JAN, etc... some have different plate designs. I've found that the plain-jane cylindrical plate, with no 'fins' on the sides, tend to dissipate color better.

Bottom line, with known voltage and current, load the rig until you get it around 300w output. That doesn't over work the tubes, doesn't load the secondary of the modulation transformer to max and if you control the output with a vari-ac, you can set the Modulator-to-final impedance match exactly where it works the best, and crank up/down the vari-ac to get exactly where you want. Stay within the guide-lines stated by Eimac 55 years ago and you should be fine.

Still, if you run the 610 on the 'low' tap (forget which model you have) of 2000v, then the figures above would be about right.
Keep in mind, the FCC rule for power output now states 1,500w PEP output. IF YOU WERE TO MODULATE THE RIG WITH A SINE~WAVE (caps intended) then the max carrier for 100% audio would be 375w. The Voltage and the current double in the final, so
PEP = carrier output(x4).

We don't talk in sine~waves. Verily, the typical male pattern voice is rather asymmetrical. In my opinion, if someone were to operate a modified AM rig properly on the ham bands, it would behoove them to read and understand the natural asymmetricalness of typical male pattern

voices. Find more at:
http://www.qsl.net/wa5bxo/asyam/aam3.html

Hope that helps.

# 4009. FS BC610E

Yahoo group: T-368_BC-610
Date: 2009-11-03 22:54:25 UTC
From: Barbara & Norman Ray
Topic: 4009  Message: 4009

FS BC610E. It has been restored to near new condition. It comes with the BC-614E Speech Amplifier, BC-939A Antenna Tuner as well as a more appropriate homemade tuner housed in a compatible cabinet (professional appearance), 17 tuning units, 19 coils, manuals, Heathkit VF-1 VFO unit as well as a LM-13 (which the original owner used for a VFO). Spare tubes for the final, modulator and others. There are two spare modulation transformers (haven't checked them). Included is a Heathkit audio speech amplifier which could be reconfigured in place of the original if desired. A coax relay is installed for T/R. The transmitter is mounted in a removable heavy duty caster base. I can mail a more complete description and pictures for serious interest. Price is $1500 pick up in the Seattle area due to its weight and my desire that you be satisfied.

I also have power supply deck for units using the potted transformers with the terminals out the bottom for best offer.

Topic: 4012  Message: 4013

If I recall correctly, it is indeed the same unit in
all relevant electrical and physical parameters--
it's just that the ones from the Beastly 610 vintage
were black and the ones from the T-368 vintage were
grey. The grey unit bolted to the top of my T-368-E
is marked BC-939-B. 20 years ago, people almost had
a hard time giving these things away at hamfests;
these days, I think so many got junked or scrapped
out that ones in either color are sort of scarce. I
suspect that Uncle Sam did not sweat the color combos
in actual deployment of them- focusing instead on
functionality- so- perhaps, think of yours as an
aesthetically mismatched but probably representative
combo.

Bob,

Practically speaking, they were correct. Technically, the first several orders of AN/GRC-26D shipped with T-368A...D/URT and BC-939-B. There are only minor differences between BC-939-A and BC-939-B. Some -B models had an MWO applied that replaced the input hot and common terminals with an SO-239 to go with T-213/GRC-26 and BC-610-F and later that had an equivalent MWO applied. I don't know whether any -A models officially got the MWO but certainly some got it from hams.

The photos in TM 11-264A (Radio Set AN/GRC-26D) is in black and white, of course, but the BC-939-B shown sitting on top of the GRC-26 appears to have been painted the same shade of gray as the transmitter. However, the several BC-939-B's I have had or seen were all black wrinkle like your -A model. Maybe they repainted one just for the pilot model and the photos. :-) The Navy would have but I sorta doubt that the Army would have put NOSB BC-939-B's through Depot just to change the color.

In 1959, the nomenclature of BC-939-B was changed to TN-339/URT, and the paint was changed from black wrinkle to gray semigloss. The inductance of L5 was changed to 6 uHy and a wire was added from the top of L5 to the movable tap.

If you were local, I would probably swap even a TN-339 for the BC-939-A. I'm as likely to find a buyer for one as the other. But aside from being an A instead of a B, there's nothing wrong with the one that you have.

Topic: 4014  Message: 4017

Thank you kindly for getting back to me on both items. We are thinking of moving to Nevada and I hope to have a real ham shack if that happens and would like to try and get the T-368E on the air. The BC-939-A is in quite nice condition and may have been reconditioned at some point. The antenna current meter has a
1966 date and the inside has a number of red/orange ink numbers that are stamped here and there.

I will check out Surplus Sales and also Fair Radio Sales-

73 Bob
K6OSM

PS- you mentioned having a T-368E, I have a number of pieces of equipment that were used with these types of transmitters, including the modulator, a noise generator?, a number of pieces that were used to
monitor and control teletype and I think I have the more common power meter and dummy load-

Hello Bob Downs,
Thanks for taking the time to write back to me. Yes, I wish we were closer, perhaps we could do a trade. The finish on my BC-939-A is smooth, not crinkle. I don't know what all that means in the scheme of things. I took the cover off tonight and checked it out pretty well with a flashlight, the meter has a 1966 date and the inside has red or orange ink numbers stamped in a number of places. It does not have an SO-239, but uses terminal connections on the left side. I guess it's a mystery..

# 4019. OT question re: lil milsurp mech digital receivers

Yahoo group: T-368_BC-610
Date: 2009-11-08 05:58:34 UTC
From: Trevor
Topic: 4019  Message: 4019

I know that someone might say that I should post this to some other group, but I can only follow so many groups, and choose to follow this one, and hope that some of you can fill me in on this question.

In about 1990, at the NH Hosstraders hamfest, a fellow had a table full of little (by mil-radio standards) olive drab receivers with mechanical digital freq. readaouts; in concept, they looked like R-392s that had been shrunken in the wash and that you could carry with only one arm.... some of them, if I remember correctly, went from low HF to low VHF, and others went from low VHF to somewhere a lot higher.

At the time the prices seemed like more than I should spend, but they were spotless refurbs in the USGI packing, and I have kicked myself ever since for not bringing a set of them home.

Can anyone fill me in on the nomenclature and specs for these two different rcvr units and how hard they are to find and what the going prices are likely to be?

Thanks
Trevor

My 939-B is an unwrinkly grey, and it is not a 339.

If I were only listing it on Epay, I could go on and
on about what an unusual and invaluable variant it
apparently is :)

Bob,

I've never owned a T-368 nor had any parts from one, other than a HV deck. So I skipped over your knob question. I just looked at the photos in several of the manuals but as luck would have it, the scans I have of the transmitter manuals that have front panel photos I didn't do. And the photos are so poor I can't tell what kind of knobs were used. I'll get one of my originals down tomorrow or Monday (Sunday is a work day for us, and a very busy one) and check. But from what I could see, I think it's a newer style knob from the 50's, and I'm unlikely to have one.

Bob,

OK. I go by "Robert", although I will answer to "Bob" is someone is trying to buy something, give me something or feed me. :-)

Now that I think more about it, the BC-610-E was black semigloss as well. So it probably dates from '43 or '44. Of course, it could also have gone through Depot. The only model of BC-610 I recall seeing in wrinkle finish was the -F. Although I've only seen a few -D and earlier. But the odd thing is that the BC-729 antenna tuner used with those earlier models is wrinkle. Or at least the only one I've ever had is.

As you say, a mystery.

One further comment I'll make is that regardless of the tuner model or color, you don't normally use those tuners with a doublet (dipole) antenna. They were made to load into a 15' or 24' whip, or a 24' to 45' end fed wire.

Robert,

Thanks again for your help. I will see if I can find the missing part for the PA Tuning knob and perhaps someone on the list may run across it someday. I don't own a BC-610, but have several parts for one. I have been the recipient of equipment from various SK over the years and have just kind of put the stuff in the corner that I didn't have an immediate need for. I just came back from my garage and found what appears to be a new set of "frequency setting cards" in a thin paper envelope, this may have been used with a "E" model, or perhaps they are all the same. In the same lot of equipment was an original manual from 1944 with the signal corps insignia on the front and the manual is for an "E" model. Also in my garage I found a rather large box of brand new (1944) coil set for a BC-610, made by B&W, it contains two (2) each of adjustable coils that go from 2 Mc to 18 Mc. The coils are in individual slots in the box and are wrapped in some kind of water proof material. A mouse has chewed open a couple of the wrappers, but doesn't look like it peed on any of them. Sorry for the long rant-

Maintenance on all of the interlocks as a first step may help.
Thoroughly clean all the plungers and receptacles and visually inspect the wiring to each. Don't forget the one on the back panel. When I was having overload trips the PS drawer interlock was found to be heating and melting. Bypassing solved it.

After that step it's on to the tech troubleshooting including checking the adjustment of the overload ckt. Others will have lots of other suggestions too.

The knob is manufactured by Raytheon and may still be production, at any rate they are frequently seen at hamfests so it shouldn't be hard to track one down.

Hi Gary,

You may want to check the 5933 clamper tube. Mine would work FB, as long as it was keyed. As soon as I unkeyed, WHAM!, the breakers would blow. Replaced the above and problem went away.

Gary,

From your message I take it this was the first and only time the overload relay has kicked in. If so, don't worry about it. No need to tear into your rig unless it starts reoccurring. My Basic will (properly) kick out if I get way too close to the mic. Maybe you did too.

# 4040. Modulation transformer seconary

Yahoo group: T-368_BC-610
Date: 2009-11-25 01:14:34 UTC
From: Barrie Smith
Topic: 4040  Message: 4040

Good evening:

I'd like to try a modulation-reactor on my HT-4B.

Not wanting to create un-needed smoke, can anyone tell me (for shore), when looking down at the modulation transformer secondary terminals, from the front of the rig, which terminal is HV and which terminal goes to the RF deck?

I "think" that B+ is to the left, which means that the right terminal goes to the RF deck.

Creaky old bones, and poor vision don't allow a better squint.

Greetings to all on the List,
I am missing two small items to complete my otherwise beautiful transmitter.

1/ One of the allen headed bolts that holds the modules to the front panels to the frame.

2/ A source for the receiver antenna connector. I only need the connector, I can make up a cable. Don't know what they are called but they are an oversized BNC style connector. I think the same one is used on the whip input for the R-390A.

All the best to everyone,

Keith VE3TS

I can't help directly with either, but you might try
googling "the nutty company" as a possible source for
the bolt, and as to the connector, it's what's known
as a "Type C connector." $$$urplus $$$ales of
Nebra$$$ka had them, last I knew, but there are
probably other, less expen$$$ive sources if you
search around for "Type C connector."

Further, for the C-connector I would recommend you look for a UG-636(*)/U adaptor. Type C male to BNC female. It's only for the receiver, and BNC to BNC cables are relatively easy to find. Technically it should be an RG-59 cable with UG-260's but RG-58 with UG-88's won't introduce enough loss in that short a length that you are likely to notice it. (*) means any letter you find in this position will work fine.

Trevor,
Thanks for the information, another list member has offered me the connector
so one down and one to go.
I'll check out the nutty company and see if I can find the bolt.

Thanks again,
Keith VE3TS

# 4046. Some amplifier parts Needed

Yahoo group: T-368_BC-610
Date: 2009-12-04 20:25:38 UTC
From: Keith Densmore
Topic: 4046  Message: 4046

Greetings,
I am in need of an amplifier plate choke, something good at 160 meters and capable of a kilowatt.
I also need 4 of 500 pf doorknobs at about 5KV.
Lemme know if you can help. Or if not, maybe where they can be purchased new.

All the best, thanks,

Keith ve3ts

# 4047. RE: [T-368_BC-610] Some amplifier parts Needed

From: Tom Mackie
Topic: 4046  Message: 4047

Hi Keith

When I rebuilt the output of my T368 I got this choke from RF Parts:

1.8-30 MHz Amateur Bands including WARC.

Ideal for amplifiers using 811A, 572B, 813, 833, 3-500Z, 8877, 3CX800A7, etc.

Used extensively in the Ameritron and similar Linear Amps.

1.5A, 225 uH, 4 KV max

Size: 5 5/8" L x 1" diameter Ceramic coil form

Part Number: RFC-3 * $24.95 ea.

Hopefully you can find one less expensive or homebrew but just in case you have to go with new, this one has been working in my T368 for years and is happy on 160m.

Hi Tom,
Thanks for the tip. I'm going to do the Timtron mod to lower the tank capacity on my T-368. No problem on the RF part price but I always ask on the list first, it provides 'seed' money' for list memebers, hi.

73,
Keith

# 4049. BC610 current draw

Yahoo group: T-368_BC-610
Date: 2009-12-05 20:20:16 UTC
From: victorsj
Topic: 4049  Message: 4049

Does anyone know how much current a BC610 should draw on modulation peaks? It blew a 20 amp circuit breaker. There may have been a couple of other things on the same circuit (light bulbs, etc). Is this normal, or is there more likely something wrong with the rig? My BC610 runs on 120 volts.
Thanks and 73
Steve WA2DTW

Steve,

If you look at the fuses on the front panel, you'll see that the BC-610 fuse is 30A. A 20A circuit is completely inadequate.

You need a dedicated 30A circuit for the Beast!

From: rbethman
Topic: 4049  Message: 4051

The "main" fuse, FS1 is 25A.

Same issue, 20A isn't a heavy enough circuit for a Beast.

I put in a dedicated 30A to run mine on.

The resistance of the Beast hasn't changed, BUT, our voltages have. The PE-95 was a 110VAC generator. Our line voltage in today's world is more like 125 to 127VAC.

Those 100% mod peaks will pull enough to "probably" pop a 25A circuit.

# 4052. Re: CORRECTION - BC610 current draw

Yahoo group: T-368_BC-610
Date: 2009-12-06 14:48:00 UTC
From: victorsj
Topic: 4049  Message: 4052

Thanks, Bob.
Actually, I couldn't find a 25 amp fast blow fuse, so I put in a 20 amp fuse into FS1.
Interestingly that didn't blow, but the breaker did.

I guess that is more evidence that the problem was that I was starving the rig for current, rather than the rig itself.

# 4053. For Sale T-368

Yahoo group: T-368_BC-610
Date: 2009-12-06 23:57:24 UTC
From: Steve Williams
Topic: 4053  Message: 4053

Please reply off list. For Sale: One T-368E/URT Serial # 250 and it includes the switch box SA-390 serial # 26 and ME-165/G Meter serial # 1. I do not have the matching tuner. The T3 is in excellent cosmetic shape except for one small paint chip in the RF Deck front panel just over the excitation input connector. The inside looks like new.
There have been some minor mods to the audio speech amp section. I have had it on 160 meters a few times and was told it sounds great. I have checked it out recently and get 500+ watts of carrier up through the 20 meter band. I bought it from the SK estate of Bernie Feissle, W0ZKN. I have had it now for about a year and a half and may have had it on the air 3 times. I have recently picked up another AM transmitter and would like to sell this one to make some room in the shack.
Asking $1700 cash and you pick it up at my home in Clarkson KY, zip 42726. I’m 8 miles from the Western Kentucky Parkway at Clarkson and 15 miles from I-65 at Upton KY.
I do have a roll around lift table that will help get each deck up level with your truck bed and I can provide plenty of help loading, etc. No, we won’t have to carry it up any basement steps. I have 22 pictures I can email to you and I’ll give you my phone number if you’d like to talk more about it.

Thanks,
Steve

List,

I offered to take this from Mike. Dave hasn't answered my message yet.

It is available in three different forms! As an MS Excel spreadsheet, a CSV file, AND as an ASCII text file.

<http://home.comcast.net/~rbethman/BC610.xls> ( Excel )

<http://home.comcast.net/~rbethman/BC610.csv> ( CSV - Comma Separated Values )

<http://home.comcast.net/~rbethman/BC610.txt> ( ASCII Text ) [ The ugliest possible form ]

Yahoo group: T-368_BC-610
Date: 2009-12-09 22:56:54 UTC
From: rbethman1
Topic: 4057  Message: 4057

BC-610 part of the Group!

I've got the registry as I posted earlier. Send any changes/deletions/additions to me Direct!

<rbethman@...>

I'm going to give it a good "try" to make it more "user friendly" than it currently is.

Bob - N0DGN

I believe it may be Bill Coleman, N2BC.

He is the owner of the database that is on Yahoo as part of this list.

Joe,

The Yahoo "system" indicates that he is the owner of the database.
You'd have to make someone else the owner to allow that database to be
modified, or you can make the changes as you are the list owner.

I've also thought about asking you to allow me to put the BC-610
Registry there as a second database - *IF* Yahoo allows more than one.

Group,

As soon as I get over the insanity, if Joe says okay, I'll take changes to the T-368 Registry.

I'm still dealing with changes, additions, and the like to the BC-610 Registry which is ALSO now a Group Database.

< I've got to be warped, perverted, and certifiable! >

Bob - N0DGN

Subject: [Hallicrafters] HALLICRAFTERS BC-610 TRANSMITTER FOR SALE
Date: Tue, 15 Dec 2009 10:55:53 -0800 (PST)
From: gallop@...
To: hallicrafters@..., boatanchors@...,
forsale-swap@...

Hallicrafters BC-610 Transmitter plus all the accessories:
Control Box,
Main Antenna tuning unit that mounts on top,
Speech Amp,
Complete set of tank coils and tuning units including the very hard to find
160m band. Extra cables, tubes, original hand mic, all in excellent
condition. Pictures
Available upon request. CASH and Carry only. Pick up near Fresno Calif.
Call 559-322-0459 for any questions. I work during the weekdays so please
leave a message and I?ll call you back. Asking $3850.00. Serious inquiries
only please. Thanks.

Mike

Oops!

Sorry to all the list.

I received a message from two subscribers that they wanted to leave the list, I didn't check the reply address before I hit send.

But that never happens,..... does it?

Joe

# 4077. Neutralization

Yahoo group: T-368_BC-610
Date: 2009-12-23 16:12:32 UTC
From: victorsj
Topic: 4077  Message: 4077

Is it common for the BC610 to be neutralized on some bands, but not on others?
On 160 meters it seems to be OK (albeit with somewhat reduced plate current). But on higher bands, the plate current rises, the plates glow bloody red, and the output decreases. My guess is that the finals are going into oscillation on 40 and 20 meters.

Steve,

Do you have TM 11-826?

Neutralization is on page 96 through 97.

It specifies using TU-52, and PA Coil C-390-C.

This is slightly different than what we are used to. We are commonly instructed to go to the highest frequency of a transmitter and perform it there.

There is ONE other very important consideration - What voltage are you feeding your BC-610? If it is simply the 125VAC from the service supplied, you WILL get higher current AND High Voltage to the final! It has been designed and built for 110VAC power.

Use either a healthy variac or a healthy bucking transformer.

# 4084. O.E.S Dictionary entry for the word "suck"

Yahoo group: T-368_BC-610
Date: 2009-12-26 06:01:16 UTC
From: Mark Foltarz
Topic: 4084  Message: 4084

From O.E.S Dictionary ( Obsoloete Electronics Syndrome )
Main Entry:  suck
Function: verb
Etymology: Middle English suken, from Old English sucan; akin to Old High German sugan to suck, Latin sugere
Date: before 12th century
transitive verb
1 : To replace the damn paper caps underneath of a BC-610-E or similar gear.
 e.g. :  "Replacing those leaky .002 & .006 ufd  caps really sucks."

# 4085. RE: [T-368_BC-610] BC-610 Registry NOW as a Yahoo Database

Yahoo group: T-368_BC-610
Date: 2009-12-29 02:44:09 UTC
From: Dave Trainor
Topic: 4066  Message: 4085

Please add my 2 units to the registry:

BC-610-I - Serial 635 - Order 3357-PHILA-52 - Manufacturer Hallicrafters
(This unit is almost restored and will be on the air soon)

BC-614-E - Serial 1433 - Order 15127-PHILA-43 - Manufacturer Detrola
Corporation (restored and tested)

BC-939-B - Serial 380 - Order 19624-PHILA-50 - Manufacturer Barker and
Williamson

BC-610-I - Serial 798 - Order 3357-PHILA-52 - Manufacturer Hallicrafters
(as-found, un-restored, needs HV filament transformer at minimum, but
all there otherwise)

Thanks Bob for taking the list and keeping it up to date.

# 4086. E model in the home stretch

Yahoo group: T-368_BC-610
Date: 2009-12-29 04:38:37 UTC
From: Mark Foltarz
Topic: 4086  Message: 4086

Well I am happy to say that the RF deck survived the recapping and has come to life.

Even enough power to light a 25 watt incandescent lamp off  C15.

The bias supply test good also.

Now to wire in a variac and bring up some HV.

The old monster may be up by the end of the year.

The speech amp has been recapped and awaits testing.

Besides desperately needing a paint job,  the 610 needs a back cover and an ID plate.

If someone has a spare back cover willing to sell and ship please advise.

Also need an E model id plate.

tnx

Frank,

The chassis connector Franks part number is UW2020FB00 (Amphenol 164-101-3). The cable male is UW1220MBnn or UW1320MBnn. Where "nn" is the rated cable jacket diameter in 32nds of an inch. Choices are usually 13, 15, 17 and 21. The 1220 is the "Dogbone" style body and the 1320 is the "Cathredral" style. The dogbone type requires a special 3-pin or 4-pin spanner to disassemble and assemble. The cathedral type only requires a screwdriver. Both need an open-end wrench for the cable gland.

There is also an Amphenol part number for the cable ones but they are longer and make less sense than the Franks numbers.

I have three of the chassis ones (Amphenol) Used, Good, $12.50. All I have for the cable end is one UW1220MB17 $15.00. It is actually mismarked as an MA13. I think someone needed a 4-pin or something but in a different body. And I swapped parts around. If you'd rather have the cathedral body, I might be able to transplant the insert.

Another possible source if none of the above appeals to you is Bill Perry (William Perry Co.), 502-893-8724.

# 4095. BC-620-E wanted in Idaho

Yahoo group: T-368_BC-610
Date: 2010-02-02 02:49:34 UTC
From: wa5cab@cs.com
Topic: 4095  Message: 4095

Group,

I had an inquiry tonight from an old customer/friend in Wendell, ID. He has acquired an HO-17 and he says most of the proper contents but lacks the BC-610-E and some of the associated bits. If anyone knows of an -E model available within reasonable radius of Wendell, please let me know. I actually have one, but it's a long long way from here to Wendell!

# 4098. T368E comes on and gets installed. Number 379

Yahoo group: T-368_BC-610

From: ke7trp
Topic: 4098  Message: 4098

Here is my T368 transmitter. Lots of trouble with this one. Mainly Speech amp and Screen supply. Now fixed and working 100%.

I made a harness for J12 with PTT, Mute and 600 ohm audio input from my audio rack. I can also run the working Carbon mic for fun.

I ran the AM transmitter rally with this unit for 16 hours. I made 61 QSO's on it on Saturday on 4 bands. Not bad. The unit seems very reliable now. Audio bandwidth is about 80 to 10K now. Sounds very nice on the air.

The Blower motor for the 400 was shot. I found a local company A1 electric in PHX AZ to rebuild it. They did a WONDERFULL job on the overhaul. They even repainted it back to the original color. Its smooth and makes almost no noise. The cost was $45!

The RXer is an SP600 JX14.

The cat is Sophia :)

This unit is a BW built E model with serial 379 on the tag. I dont know how to add it to the database but I would like it listed.

Here are the pictures I uploaded.

Good job, Clark. Steve and I heard you pretty well in Williamsburg VA Saturday night, I think Steve was at the mic then. We were running W3Z.

Sounds like you have a couple of solid rigs there now for AM use. Hope to hear more of you as the season progresses. My T-3 is still waiting in the queue with a HV short.

# 4100. FS: BC-610 Package

Yahoo group: T-368_BC-610
Date: 2010-02-23 15:13:13 UTC
From: John Poulton
Topic: 4100  Message: 4100

After considerable soul-searching, I've decided it may be time to part with my BC-610--it's been sitting a long time waiting patiently to be brought back to life, but there are a lot of other projects also waiting, and life's short!

This unit is a BC-610E. It's in pretty decent, though somewhat filthy, condition. A good cleaning may be all that's required to bring it back to working order. The "meter" face for the PA tuning will need to be replaced, but I have a NOS one. Other than that it appears not to have been molested and is complete.

I'd like $2000 for the transmitter. Now, before you gag, or bust out laughing, consider that this is a *package*. Along with the transmitter, I also have:

- A fairly good BC-614 speech amp, and a couple of nasty ones that could serve either as parts donors or restoration candidates
- A pretty nice BC-939 tuner--I believe this tuner may have been original with the transmitter--it's complete and appears unmolested
- Bunch of fixed vacuum caps and other spares (if I can find them!)
- Spare mod and power transformers
- A NOS 250TH in its springy thingy, perhaps a dozen or so 100TH's, and (drum roll) a pair of NOS RCA 2A3's.
- Dozens of PA coils, many in very nice shape, including the somewhat rare 160M one
- Dozens of Tuning Units in a variety of frequencies, enough to fill 2 large plastic bins
- Several hundred crystals, some of which are actually in ham bands!
- The rarum/unobtainium octal-connectorized cable, BC-614 - BC-610
- Several original manuals
- Probably other stuff I've collected and forgotten about; I've been grabbing BC-610-related stuff at hamfests for 10 years

If there's any interesting in this package, please let me know privately and I'll take pix of the equipment for you. This would be, needless to say, pickup only in Chapel Hill, NC. And, no, I won't sell individual items; the whole lot needs to go!

Could happen, Tom. My transmitter just happened to come with a HUGE
pile of goodies, and I'm sure that helped. You doing ok? Did you
ever get up with Doug Massey re R-390's? I met him 2 weeks ago.. a
really nice guy, very knowledgeable, and a *deft* hand at restoration.
He had an R-390A on his bench that positively *gleams* and worked
beautifully... You guys definitely need to talk.. :)

Cheers,
jp

Clark,

I don't have a T-368 to look at to see which flavor of captive nuts were used. But McMaster.com would be a good place to look. When I was converting/restoring my 40 KW Onan I needed a bunch of the type where the nut is square, with a sheet metal frame wrapped around it, and that fit into a square hole. That's where I found them. Note that that type are made for various panel thickness ranges. I'm not sure what other types McMaster might have.

==========

I don't have a 368 but this sounds like it could be a PEM Nut from PennEngineering.
http://www.pemnet.com/

www.mcmaster.com/
Search Pem nut which shows Pem style captive nuts.

They all show the round type of captive nut. I have now searched for hours. This is a simple square hole in the chassis. The problem is that we dont know what this nut is called.

PEM nuts are round on the diagram
Captive nuts are round.
Expansion nuts look to be right but they dont have a nut, Its just sheet metal.. That wont hold.

If anyone has any ideas let me know!

Thanks!

Clark

It took a little digging (I used most of those I bought and didn't have an original box to look up the part number on). They are called "clip-on" nuts. Go to <http://www.mcmaster.com/#square-style-nuts/=601iec>.

# 4117. FS: BC-939-B Antenna Tuner

Yahoo group: T-368_BC-610
Date: 2010-02-27 17:14:04 UTC
From: John Poulton
Topic: 4117  Message: 4117

I have a nice BC-939-B Antenna Tuner for sale. It's gray in color (matches the scheme on most T-368's), built by Barker & Williamson, S/N 98. Condition is good, though not perfect. Paint scrapes and chips on cabinet. Front panel quite good. Operational condition unknown, but these things seem fairly bullet-proof.

Will deliver to any North Carolina hamfest or to Dayton, or pickup in Chapel Hill, NC. Really, truly, seriously, prefer not to ship! Asking $400. Be happy to send pix to anyone interested.

Be very careful with the bolt length!

The wiring harness is right behind where the bolt goes.

It took a little digging (I used most of those I bought and didn't have an

original box to look up the part number on). They are called "clip-on"

nuts. Go to <http://www.mcmaster .com/#square- style-nuts/ =601iec>.

In a message dated 2/27/2010 8:28:01 AM Central Standard Time,

Subject: [T-368_BC-610] FS: BC-610 Package

After considerable soul-searching, I've decided it may be time to part

with my BC-610--it's been sitting a long time waiting patiently to be

brought back to life, but there are a lot of other projects also waiting,

and life's short!

This unit is a BC-610E. It's in pretty decent, though somewhat filthy,

condition. A good cleaning may be all that's required to bring it back

to working order. The "meter" face for the PA tuning will need to be

replaced, but I have a NOS one. Other than that it appears not to have

been molested and is complete.

I'd like $2000 for the transmitter. Now, before you gag, or bust out laughing,

consider that this is a *package*. Along with the transmitter, I also have:

- A fairly good BC-614 speech amp, and a couple of nasty ones that could serve either

as parts donors or restoration candidates

- A pretty nice BC-939 tuner--I believe this tuner may have been original with

the transmitter- -it's complete and appears unmolested

- Bunch of fixed vacuum caps and other spares (if I can find them!)

- Spare mod and power transformers

- A NOS 250TH in its springy thingy, perhaps a dozen or so 100TH's, and (drum roll) a pair of NOS RCA 2A3's.

- Dozens of PA coils, many in very nice shape, including the somewhat rare 160M one

- Dozens of Tuning Units in a variety of frequencies, enough to fill 2 large plastic bins

- Several hundred crystals, some of which are actually in ham bands!

- The rarum/unobtainium octal-connectorized cable, BC-614 - BC-610

- Several original manuals

- Probably other stuff I've collected and forgotten about; I've been grabbing BC-610-related stuff at hamfests for 10 years

If there's any interesting in this package, please let me know privately and I'll take pix of the equipment for you. This would be, needless to say, pickup only in Chapel Hill, NC. And, no, I won't sell individual items; the whole lot needs to go!

I measured my bolts, clip on nuts and panel thickness on my T-368A. As best as I can tell, it measures 3/8 - 16 with a panel thickness of .125". Therefore it would be McMaster-Carr's part number 90680A156 for $7.65 for a box of 10. My T-368 needs two so I place the order Thanks for the tip.

You're welcome. They install from the rear. To install, you need a small pair of parallel jaw pliers (AKA Channel-Lock). Adjust the pliers to the channel next larger than the width of the relaxed spring hooks. Squeeze the two hooks together with the pliers, push into the hole, and release. You can also install with a thin blade screwdriver but that requires considerable clearance to one side of the hole. If for some reason you find you have to remove one, loosely tape the back of the nut to the panel or frame with masking tape. Tap lightly on one of the hooks with about a 3/8" wide slot screwdriver (tape is to keep the released nut from disappearing into the guts of the transmitter).

Did my first crystal grind for the BC 610 last night.
Got darn close.
Started with a 3570 and ground up to 3655.3 .
Overshot by 300 hz.
Might try to "pencil it down."

hello mahlon. i grind xtals using a simple technique. you need a small sheet of plate glass, and some 80 grade wet or dry abrasive paper. the next to finest will do.
remove the slab from the holder, carefully noting how it was secured. the plates have two different sides. one smooth, and the other with slightly projecting corners. these are the ones which enable the slab to vibrate, so it must be between these.
wrap the abrasive paper tightly round the piece of plate glass and wet it.
use a figure of eight motion to grind the slab.do this for say 1 minute, wash the slab , re assemble it and measure the frequency.you will then know roughly how long to grind for.
only grind on one side.
about half way to this time measure the frequency again to give you a better idea.
when you get near, use shorter intervals between measurement. if you overshoot, rub a little pencil lead or solder in the centre to drop the frequency.
this can easily be removed if you overdo it.
all this may sound tedious, but it really is no trouble.
hope this is of use. alan g4gen

Mahlon,

I read several pages about grinding. I have at the shop a stick of green compound and some of the Dremel grinding compound. Both seemed to full of wax and oil. I decided to try wet sandpaper and figured 220 and 300 would work.

The day before I scrapped out an old microwave oven with rotating tray. Nice flat with glass with a lip around the edges - water stays put.

I quartered the sandpaper sheets. I placed a piece of sandpaper abrasive up on the glass and put a enough water to puddle on the paper.

Holding the paper with one hand and the crystal with the other I began making figure 8's. I held the crystal with my 1st and 2nd fingers at diagonal corners of the crystal. Every 25 or so figure 8's I would rotate the crystal 90 degrees to insure equal abrasion on all parts of the crystal.

I then rinse , dry and reassemble the crystal. Then check for progress of frequency change.

For my 610, I wrapped a piece of wire around the 6V6 oscillator tube and couple to a frequency counter.

Several times the crytal refused to oscillate or lost activity. To restore operation I would bevel the edges of the crystal on all four corners and on both sides.

gud luck & 73

Well, if it like the one I scrapped out, to get that working would have
been a Rube Goldberg Special!

Let's see - it runs the fan, the rotating glass part by a huge rubber
O-ring, AND BTW it is directly coupled to the interior piece that
spreads the electrons all through out the inside of the oven.

Duh! They do NOT make them like the old Tappan that was a built-in at
my Father-in-law's house in Georgia. He bought that place about 1966.

The transformer went tennies up in the early '80s. Couldn't by one
ANYWHERE.

Now its all throw away junk! The transformers are useless! I haven't
found a decent one since 1980. I used that one for a pair of 813s.

Joe,

  Funny you should mention that.  I am making a foray into the world of blade sharpening as a side line. And one of my tools seems to fit the bill for moving the abrasive while holding the rock steady.

hello mark, for years i used an abrasive paste made from fine carborundum to grind xtals.however it was necessary to clean them scrupulously, and my success rate was poor, as often the xtals would loose their activity. i then learned the technique of using fine aabrasive paper . what a difference !
i have never had a failure, and it is much easier to control the rate so that i seldom overshoot by much.
cleaning is no problem, as all i do is a quick wash under the tap. alan g4gen

# 4135. BC-610/HT-4 on Ten Metres?

Yahoo group: T-368_BC-610
Date: 2010-03-11 21:15:42 UTC
From: Roger Basford
Topic: 4135  Message: 4135

Hi All,

Does anyone have data on coils and tuning units for 18-30Mc coverage for the '610/HT-4? I have come across a handwritten note in a post-WWII HT4-I manual that refers to a 10 metre conversion kit listed under "Spec Sheet # 93M597" and "Bill of Material" # 59X029. Where these kits generally available and how did the '610/HT-4 handle on Ten?

Topic: 4135  Message: 4136

Roger,

The HT-4 came out with ten meters as part of the original radio, and was advertised as such.

The Military BC-610 version did NOT incorporate 10 meters. The U.S. Army Signal Corps found significant problems with attempting to operate on 10 meters. They are VERY well known to end up with RF crawling all over the cabinet.

This was most likely due to their specific requirements to operate in the communications Housing on the 2 1/2 ton truck, and initially in the "panel" truck.

Mobile operations, which indeed they did by the installed whip, did not allow for a solid ground to earth.

They only had such a ground when they set up in a fixed location.

The other thing that I haven't been able to track down, is related to the distance that was a requirement of the BC-610 package. They were specifically to be used at a range of 100 miles.

Ten meters can be finicky at that range unless propagation is favorable. Using the whip antenna, without a good counterpoise, makes 10 meters an iffy situation.

It is by NO means the same as having a whip on the roof of an automobile with its entire body as a counterpoise.

BTW - My information regarding the ten meter attempt resulting in RF crawling all over the cabinet, came from a Special Forces individual that operated these in Europe and at Arecibo, Puerto Rico.

Hi Bob,

I looked closely at the October and November 1938 adverts and you are right, they did offer Ten metres coverage. I doubt the Signal Corps had much use for such high frequencies but I believe that 1941/2 was a period of good sunspot activity and the high end of HF might have been of use, but generally propagation at that part of the spectrum tends to be difficult to forecast, great for hams but not for reliable mil comms.

I have quite a selection of TUs and PA coils - but nothing above 18 Mc, so if Ten picks up for some across the pond paths I'll have to use a smaller rig, like my Labgear LG-300!

Thanks for the follow-up.

I have used this transmitter for 6 months. It worked perfectly. I cam in the shack today, warmed it up, tuned it on 75. Full output. When I unkey the transmitter, The SCOPE, Bird watt meter and SWR meter SHOOT up with a big signal. Then it Drops out.

Normaly, When I unkey, the carrier just goes away. Now, the meter shoots up past 1KW, The scope shows FULL mod, and the SWR meter shows 5 to 1 for about half a second, then it Drops out.

Any ideas? It looks like there is an oscilation or maybe the relays are not Dropping out in the right order?

THanks!

Clark

PA self-oscillating? That high SWR probably means it's taking off at a much higher frequency than 75 metres. Check your neutralisation setting.

I think your initial assessment makes more sense, Clark. Clean some contact relays. It sounds like the transmitter is staying keyed up before than antenna change-over relay drops out. Might check the discharge capacitor(s) on the contacts, as well.

Hello Group,

(1) Could anyone in the group with experience with the TMC GPT 750, tell me if this transmitter will tune to 1945 KC with the internal MO? (I know the manual says 2 mhz on the lower range, but the MO mechanically goes to below 1945 KHZ).

(2) And will the driver and amplifier load on 1945 KC without modification?

(3) Thirdly, what should one sell for with the TMC built AM Modulator?

I found one in fairly good condition, and want to make a fair offer.

Thank you for your help.

re: GPT-750

I repaired GPT-750's when I was in the Signal Corps - - Under no circumstances were we ever to go below 2 MHz or above 4 MHz on the GPT VFO or on an 0-330/FR (VOX-5 VFO). If you go past those limits it is sure to ruin the calibration and require a depot level repair. I seem to remember something about getting an "article 15" (military lingo for a reprimand) if you abused the equipment in that manner. Anser is to going below 2 MHz, not recommended unless you use an external source and not the internal VFO.

It is oscilation! I was talking on the phone with another T3 owner. He told me you are tuned to the wrong dip. The rig was at 250mills dipped perfect. I turned the load to the right to 300, then dipped it back down and it dropped all the way to 200. I then turned the load up again and got it to dip at 250 again. MORE overall load. The problem went away.

I will have to make a new "chart" for the tuning on my coax, and tuner.

Hello folks,

Yes, the BC-610 did have a TU and PA coil that went to 10 meters. I had a couple of each in my collection back in the early 1960's It also had TU's and PA Coils to go down through the broadcast band, and also went down to the 200 - 500 kHz band. Many places in the far east and Europe had areas that used a BC-610( ) as an AM Broadcast transmitter to get news, music, etc. to the troops and their dependents. As for use on 10 meters, RF on the case was preventable only if a good SHORT ground was connected to the cabinet. The big problem, however was output power. The 250-TH was not designed for use much above 18 or 20 MHz. Oh, yes, the receivers which were normally used with the BC-610( ) only had an upper frequency range of 18 MHz. While the TU's, etc. were on-hand, there wasn't much use for them!

The first comment that needs to be made:

1) No where in the Army TMs, are TUs and PA coils below 1500Kc, nor any TUs or PA Coils above 18 Mc.

2) The Eimac 250TH is rated for 4000Vdc Max and 40Mc.

The Broadcast band TUs that were additional are TU-60 and TU-61. They weren't standard issue with ALL the BC-610s.

Bob,

You're correct AFAIK about no mention in manuals of TU's and coils above 18 MC. Although I've also seen both. However, it was never clear whether they were civilian or military.

But on the below 2 MC end, you must have meant nothing below 1000 KC. Coil C-455 and TU-62 cover 1.0-1.5 MC (TU-60 covers 15.3-21.0 MC and goes with the BC-375, part of a jammer system).

I will add (personal experience) that you can run a BC-610 on 770 KC successfully. When I left for Vietnam in 1967, my first BC-610-F was sitting in the transformer vault of a dormatory at LA Tech running carrier current on 770. We modified a TU-62 and padded the C-455. At the other end of the campus was a modified T-47/ART-13 doing the same thing.

I might add that in 1965 I visited a "Limited Coastal Station" in Hoquiam, WA where I saw a BC-610 in operation, A1 on 468 and 500 KHz.

There was also an amplifier, manufactured by B&W. It used an 833 in the final. Remember seeing one, paired with the 610 in a HU17 hut. The 610 was used as the driver. Forget what the number of this unit was. No doubt someone on list will know.

Robert,

You are correct! I screwed the pooch once more!

I "should" have picked up the TM. I forgot about the extra PA Coil that took it down to 1000Kc.

That's what happens when you get older and "try" to rely on memory alone.

As Ed wrote to me direct, I replied direct. The one thing that I openly agree about, is Uncle Sugar "always" managing to do those things that are non-standard.

I am not surprised to hear that Uncle obtained some 10mtr TUs and PA Coils. Nor do I feel surprised to hear that they also apparently obtained some PA Coils and TUs for below 1000Kc.

You and I are both aware how Uncle has done things!

Bill and the Group,

There are many of us that are aware of the amplifier that was built and used. "If" memory serves me, it was a 5KW beast.

I personally have never actually seen one.
As I have replied to Ed and Robert, Uncle Sugar's proclivities to procure and put into use "non-standard" components is NOT a surprise!

Uncle probably put into their contract for these items on a limited basis. Since Hallicrafters already sold the HT-4 with 10 mtrs as an option, it would have been easy to simply "requisition" the necessary components. I was completely unaware of the components for use down below 1000Kc. However, I'll say again that I do not feel a surprise in this.

I'll follow this up by saying that either sets of components will be hard to find. I know that finding the TUs for use below 2000Kc is difficult. I've obtained the PA coil for 160mtrs. I modified a TU that was for 2Mc and up, to work down as far as 1600Kc. It probably isn't as efficient as the designed one, but it gets the job done.

On that note, I have to admit that I haven't the property space to run a 160mtr dipole. So this year I am going to go the route of stringing what Uncle Sugar called a "long wire" and use the BC-939 and the necessary capacitors to get there.

I will say to the group, especially those that do NOT understand, that the BC-939s are NOT an antenna "tuner". They are an antenna "coupler". The output impedance of the BC-939 is close to 300 ohms. So one must give some care as to how they implement this item due to possible shack RF issues.

AN/MRC-2 through AN/MRC-2D are covered by TM 11-624 and TM 11-624A. Plus various changes. All models of AN/MRC-2 used AM-141/MRC, AM-141A/MRC or AM-141B/MRC.. All models of AM-141(*)/MRC use push-pull 833A's. I've no doubt that someone built an amp using a pair of 4-1000A's but it was something other than AM-141(*)/MRC. The plate tank coils look like BC-610 coils on steroids. The grid tank coils are BC-610 plate tank coils with low impedence fixed links. I once had the full set. And supplied them to a collector in OK who had one of the amps but whose set of coils was destroyed in a farm building fire. I think I recall that his nickname or name was Curly or Curley, and that he drove a fishtail Cadillac. On the trip down here to collect the coils, something blew out the windscreen of the Cadillac and he and his wife arrived in somewhat windblown condition. Anyway, I don't think that I ever heard anything further from Curly. And always wondered what became of the amp and the coils. I'd guess that he and his wife would be in their late 80's or early 90's today, if still alive.

I'll add this to what Bob has written. The BC-939 (and its predecessor the BC-729) were intended to match the BC-610 to the standard 15' nominal military whip antenna, and to the optional 24' whip and 45' wire antennas. When the SCR-499 (and some SCR-399 and -299) were supplied with the doublet antenna kit (later known as AN/GRA-4), the BC-939 or BC-729 were disconnected and were not used. The BC-610 with rotary link coils will match a doublet with no external tuner.

As an aside, you do not want to use fixed link coils in a BC-610 with a doublet (AKA dipole) because you have no loading control.

w8mnq "the 2nd"

++++++++++++ +++++++++ +++++++++ +++++++++ +++++++++ +++++++++ +

Hi All,

Does anyone have data on coils and tuning units for 18-30Mc coverage for the '610/HT-4? I have come across a handwritten note in a post-WWII HT4-I manual that refers to a 10 metre conversion kit listed under "Spec Sheet # 93M597" and "Bill of Material" # 59X029. Where these kits generally available and how did the '610/HT-4 handle on Ten?

I have several of those smaller fixed link coils.  Thought they were for use in the final of the 610 when used with the 939.  Must be dumber than i thought! duh!  Anybody need some? I also have a tuning unit somehwere for either the 500-1000 kc or 1000 kc to 1500 kc range. Don't remember which.  No transmitter to put it in.  Just missed out on a coil for the 160 meter range couple years back.  grrrrr.

# 4158. T-368E Technical Manuals

Yahoo group: T-368_BC-610
Date: 2010-03-26 03:04:57 UTC
From: commtekman
Topic: 4158  Message: 4158

Hello Group,
I have had a T-368E now for about 10 years and thought I had manuals
that covered this transmitter, but to my surprise I apparently don't have anything but the
TM 11-809-10, it includes changes C1,C2,C3 & C4.
Doing some research it appears that I might also like to have
TM 11-809-20 and TM 11-809-35. My question for the group is, are
there more current TM's that cover the "E" model that I should be
looking for?

I have a very very nice BC-939A antenna tuner that I am going to sell
if someone is looking for one. Also, I have a box from 1941 or 1943
that has two (2) each coils for the BC-610 and I don't have a 610,
so I don't want to haul it to Nevada when we move.

Thanks & 73
Bob Schaefer
K6OSM

Bob,

The original manual on the T-368/URT was TM 11-809 dtd 04/22/55. Based on other sets of the era, there could have been a slightly earlier Preliminary but if so I have never come across it. In 1958, TM 11-809 was replaced by TM 11-809-10, -20 and -35. Changes were published to these as later models (higher letters) came out, up through 1965 in the case of the -35 and 1973 in the case of the -10. Unlike several other sets of the era (such as R-390, R-390A and AN/GRC-19), it does not appear that that the manual set was ever revised and replaced by a Long Number set.

So you need the -20 and -35 plus any changes to the -10 that you don't have (the last was Change 5 dtd 10/19/73).

The set was assigned a long number sequence, TM 11-5820-258, in 1961 when the -20P and -35P were published (unfortunately I do not hold -35P). And there were several MWO's (Modification Work Order) published, the last that I have record of being MWO 11-5820-258-35/5 dtd 09/22/65. I don't hold /1. /3 doesn't appear to apply to the E.

So the short answer to your question is yes. I have some of them available as reprints (the only one I have extra originals of is the -10, which you have).

Bob,

Thank you kindly for getting back to me. My TM 11-809-10, as you know is an operation manual and I am
glad to have it, but would like to find an original hard copy of the -20 and -35 manuals also, which may take some time. I guess tonight I am just gathering information. You mentioned TM 11-5820-258, I am not clear as to whether or not TM 11-809-20 & TM 11-809-35 are combined in this TM or not. I appreciate your time
and help. Occasionally "Chuck Strozier" comments on this group, he and I were in Germany 50 years ago
on the same Army base, small world!

Bob,

The original manual on the T-368/URT was TM 11-809 dtd 04/22/55. Based on other sets of the era, there could have been a slightly earlier Preliminary
but if so I have never come across it. In 1958, TM 11-809 was replaced by TM 11-809-10, -20 and -35. Changes were published to these as later models (higher letters) came out, up through 1965 in the case of the -35 and 1973 in
the case of the -10. Unlike several other sets of the era (such as R-390, R-390A and AN/GRC-19), it does not appear that that the manual set was ever
revised and replaced by a Long Number set.

So you need the -20 and -35 plus any changes to the -10 that you don't have
(the last was Change 5 dtd 10/19/73).

The set was assigned a long number sequence, TM 11-5820-258, in 1961 when the -20P and -35P were published (unfortunately I do not hold -35P). And there were several MWO's (Modification Work Order) published, the last that I

Bob,

I tend to forget that most people aren't up on the various TM numbering schemes used by the Army, Navy, AAF, Naval Air and Air Force over the decades. TM 11-809 is a Short Number, from a system used by the Army from about 1938 to 1955. TM 11-5820-258-20P is a Long Number, used from around 1956 to 1958 through at least the 90's. TM 11-809-10 is an in-between, used briefly in the mid 50's. Maybe a dozen TM 11's used like that before change over to the Long Number system.

So, no. TM 11-809-20 and TM 11-809-35 were never revised as TM 11-5820-258-20 and TM 11-5820-258-35. Only the Organizational and Depot parts manuals and the MWO's got the long number format. The T-368 is one of maybe half a dozen sets that never got revised long number manuals.

You're welcome. Good luck in your search for originals. I some 40 years of collecting manuals, I've come across several TM 11-809-10's, one -20 and two -35's.

From: commtekman
Topic: 1066  Message: 4164

I have a number of items that are for a BC-610, probably a BC-610E model. I have an original manual with signal corps insignia on the front and a date of about 1942, also I have an old envelope that
contains tuning cards for the "E" model. Also, I have a BC-939A
antenna tuner and last, a big old heavy box with brand new coils,
two (2) each for the complete tuning range. This box contains coils
wrapped in some kind of tinfoil and they have never been opened before.
Since I do not intend to ever own a BC-610, I would like the members of this list to have the first chance of owning this stuff if interested. I will consider any offers on any of these items.

I made it to the garage door that had the box, there is about
four feet of snow in front of it. The box with the coils is
marked: Rotary coil sets, 12-1944, Barker & Williamson, sets
1735-1741, (2) each. High frequency end was 18 Mc, couldn't read
the low frequency end printed on the box. Hope this helps-

Subject: [T-368_BC-610] T-368E Technical Manuals

Hello Group,
I have had a T-368E now for about 10 years and thought I had manuals
that covered this transmitter, but to my surprise I apparently don't have anything but the TM 11-809-10, it includes changes C1,C2,C3 & C4.
Doing some research it appears that I might also like to have
TM 11-809-20 and TM 11-809-35. My question for the group is, are
there more current TM's that cover the "E" model that I should be
looking for?

I have a very very nice BC-939A antenna tuner that I am going to sell
if someone is looking for one. Also, I have a box from 1941 or 1943
that has two (2) each coils for the BC-610 and I don't have a 610,
so I don't want to haul it to Nevada when we move.

Thanks & 73

Hello Perry,
I have several people interested in the coils and have received some offers. I didn't really want to make
this an Ebay thing, just thought people could make a decision if they were interested in any or all of the stuff and submit an offer and then I would sell to the highest offer. I don't plan on ever getting a 610 as I have a T-3 and that's enough for me. These coils are in a Signal Corps box from 1944, only 66 years ago!
I plan on waiting a week so most people will have had a chance to find out about this stuff and then end it.
BTW, I have a WRL Globe King 500B that I want to get rid of if you know of anyone?

Hello Group,

I have had a T-368E now for about 10 years and thought I had manuals

that covered this transmitter, but to my surprise I apparently don't have anything but the TM 11-809-10, it includes changes C1,C2,C3 & C4.

Doing some research it appears that I might also like to have

TM 11-809-20 and TM 11-809-35. My question for the group is, are

there more current TM's that cover the "E" model that I should be

looking for?

I have a very very nice BC-939A antenna tuner that I am going to sell

if someone is looking for one. Also, I have a box from 1941 or 1943

that has two (2) each coils for the BC-610 and I don't have a 610,

so I don't want to haul it to Nevada when we move.

Thanks & 73

Bob Schaefer

From: neil277@juno.com
Topic: 4172  Message: 4172

Just spotted a BC-610E on eBay; item 230456206207. Located in Atlanta. In the photos, I see a lot of rust, one broken tube and 10 tune units (no model numbers). No info on output coils. No bids so far.

not mine

# 4173. tn-339 tuner hookup?

Yahoo group: T-368_BC-610
Date: 2010-05-15 20:52:54 UTC
From: ke7trp
Topic: 4173  Message: 4173

Hello.. I have 809, 35, 10 and 20 manuals. The Tuner 939 or 339 is mentioned several times. However, They do not mention hook up of the antenna or type/length of antenna.

1.Was there a guidline for the length of the long wire? There must be as there is a tuning chart

2. How did the whip antenna hook up? Was it coax fed from tuning unit to whip?

I would like to use my T368C with 339 tuner to load a Vertical antenna. The antenna I have is a military antenna used on a ship or boat. I do not know its type or name. It has a HUGE ceramic insulator about 14+ inches in diameter. This base, must weigh several hundred pounds. The Whip seems to be 50 or 60 ft tall. I have not measured it. Its laying down taken apart.

The Transmitter/tuner will be at least 75 ft from the antenna. I am unsure how the best way to hook this up is as I have little info on the tuner itself.

Is there another manual I need?

Thanks alot!

Clark

Topic: 4173  Message: 4174

The tuner for the BC-610, the BC-939, was attached directly to the top of the transmitter. The open rear of the BC-939 fed directly out its back to the bottom conductor of the whip that was mounted directly to the enclosure on a 90 degree base that bolted to the comm shelter.

There was never a method to have the whip the distance away from the tuner, (A misnomer - it is a "coupler".), as you are describing.

Neither was there a "whip" on vehicles that was 50 to 60 feet in length.

The manual you need is TM 11-826 that covers the BC-610 family tree and the BC-939. (Should be the same as the TN-339.)

The "long" wire used with these "couplers" are in their respective TMs, and the BC-939 is in the TM 11-826.

It can be located at: <http://eshop1.chem.buffalo.edu/>

In fact, there is a quote there:

The BC-939(*) antenna coupler, is not an antenna tuner, it couples the RF from the transmitter to the
antenna only. It does this by presenting a 50 ohm load to the transmitter, and then passing RF on to the
antenna, which can be either an end-fed long-wire configuration, or a 15 foot whip, fed at the base.

The 15 foot whip is what was normally mounted on vehicles for use with either the BC-610 OR the T-368.

The whip you are describing MUST have come from a ship. Think about a vehicle going down a road with a whip that long! The first energized power line takes out the tires! <Saw that on even the 15 foot whip when the driver didn't pay attention to the sign at a maingate overseas that warned about LOW STRUNG HIGH VOLTAGE LINES - LOWER ANTENNAS!>

From: Alan Morriss
Topic: 4173  Message: 4175

hello clark, the bc 939 antenna coupler can only be used in very restricted conditions. in table iv the exact lengths of long wires are specified. range 2 to10 mhz and15 to 18, 25 feet. 2 to 6 and 11 to 18, 25 feet. 2 to 4 and 10 to 18, 45 feet. 2 to 3 and 9 to 18, 65 feet. the whip antenna can have extra sections added.
the 939 is mounted on top of the bc 610,and a short piece of wire connects it to the base of the whip at the bottom of the insulator. it is connected to the bc 610 bu a short piece of 75 ohm coax.the "long wire" can be connected to the base instead of the whip.
the best way to match a doublet is by something like a johnson kilowatt matchbox. i find the proper coax works beautifully into a resonant dipole, but any other piece of coax does not. alan g4gen
the 939 will not work any other way.

Thanks for the lengths and information Alan. I really appretiate it. The hookup is clear. Now, I will design a system of how to hook up my vertical.

You are way over reacting for someone who obviously does not know what he is doing. My recommendation is to get rid of the 939 and use a matching network at the base of the ship's whip. You will have to change it when you change bands. That way you can feed it with 50 ohm coax directly. I have a T-368F and I use an inverted V at 75 feet with each leg 145 feet long. Feed it with home brew ladder line with 6 inch spacing. In the shack, where the ladder line comes in, is a monstrous tuner I built and it works great on all bands. I have had many 939s over the years and never found a reason to keep them, as I do not intend on using my T-368 with a short whip in a truck. Open your mind, learn a few things, and then best of luck. 73 - Mike

Roughly Mid-War (depending upon where you lived) there was a doublet (dipole) antenna made available for the SCR-299/399/499. With it, you had to have the rotary link plate tank coils (else you could not adjust the loading) and you did not use the BC-939-A. FWIW, the Doublet stayed in service into the 70's, although the nomenclature changed twice.

If someone mentioned this, I missed it. Within the limits of the end fed wire table Alan posted, the BC-939-A, -B and TN-339/GR could match the roughly 50' vertical. But not anywhere other than at the base of the vertical. If you mounted the tuner at the antenna you could successfully feed it with coax. But if you mount it at the transmitter, the 75' of wire between it and the 50' vertical would amount to a bent 125' end-fed antenna. Sort of an inverted "L".

Totally agree, Mike.
As far as I am concerned the couplers mentioned for running the '610 and '368 mobile are only good for that purpose. Now, if you're going to load up a screwdriver...

hello, i was just saying what the 939 was intended for. obviously you are not going to use it in a vehicle ! i have the complete scr 399 set up, and it works a treat. if you separate the 039 from the antenna, or try and use any other lenth of wire it does not work.
i hope you have a lot of fun. cheers , alan g4gen

Why dont you try reading my post BEFORE you answer? I stated that the vertical I have is for a ship and never once even mentioned a vehicle.

The thing is used with a long wire antenna. That means, I can too :) Thanks for the lesson on coupler vs tuner OM.

I will look up or order the antenna manuals and I am sure those will help me.

Thanks

C

I will look up the manuals for the antennas and that will

Roger,

I agree on the BC-729. The transmitter is also a BC-610-D or earlier.
Must be an early ad hoc installation. The "official" one uses parts from the
SCR-499. And a lot more of it.

First I have to say that's a VERY pretty station you have set up!

As for the jeep photo from Africa, hmmm. I've heard of such setups before, but this is the first photo I've seen! A good percentage of stations during WWII were assembled as-needed, so there may not have been an official designation for such a lash-up. There weren't many high power HF land-mobile stations, so it makes a bit of sense. Looks rather spiffy too!

I also Googled "BC-610 in a jeep" and got quite a few hits.

Anyone know what the designation 412 SIG on the side of the jeep means? The caption says the photo was taken in Tunisia.

Sorry about the typo, I did mean the BC-729 tuner.

The 412 SIG would have been a Unit Designator, such as the 412th Signal Battalion, (or Regiment).

Poor jeep!

great setup there Roger.  You've got to many SX-28 receiver tho.  I've been known to accept disposable items.  here in the state we are starting a "redistribution of wealth" program so i need to figure out how to include you in this.  Hmmmm.  Now lets see.

Otherwise do both the 28's work well or is one a "kinda" works item?  What all have you done with them?  Again, nice looking 610 there and i'm envious.

Larry,

You rascal! You put the squeeze on him before I could figure a way to!
(LOL)

I bet that jeep developed a definite list to port!

Sorry guys! Those SX-28s both went to other collectors a while ago, I should really have updated the photo album! I still have the BC-610-E though, but nowadays it's paired with either an HRO-50T or a Hammarlund HQ-170A, not so classic as the SX-28 but better RXs, IMHO. The SX-28A and its Jensen R-12 speaker were subject of an article in Electric Radio magazine a couple of years ago if you want more info.

I was wondering how they kept the radio gear dry in that jeep? I know North Africa is fairly arid but when it does rain.....!

# 4200. scr 399

Yahoo group: T-368_BC-610
Date: 2010-07-03 19:10:50 UTC
From: Alan Morriss
Topic: 2917  Message: 4200

hello guys, some of you may be interested in the saga of our BC 610. a year ago at the war and peace show it worked perfectly, and we made many contacts on both am and cw . on arriving home i set it up in the tank shed and there was no ht getting through to the exciter. i assumed that the smoothing choke was u/s, so took the rf deck off to get at it. it was perfect, so i attended to some minor faults, and put it back together. just the same. i then determined that the T5 transformer must be faulty. the winter was coming on, and i put it off until the warm weather. i kept putting it off, as it is murder working on the bc610 in the shelter. you have to lie on your side bent double.
eventually, we decided to take it out of the shelter and fix it. the shelter could be cleaned as well.
with it on the floor, the fault took about 30 seconds to see.the ground connection from the centre tap of the heater winding had come adrift. the nut must have fallen off some time ago, and the tag gradually worked itself down the screw. the trip home finally did it.
it is a fair bet that when it was originally assembled the nut had not been tightened properly.
anyway it has been an opportunity to clean the shelter and the inside of the bc 610.
has anyone else ever heard of this happening ? alan g4gen

hello jim, yes we have everything, the whole shooting match. it originally was used in the ardennes offensive, and left behind in luxembourg when the germans retreated. after the war it was given to the luxembourg army. last used in 1964. after many years in storage it went to holland, where we got it.
the bc 610 has been unservicable for some time, but i have fixed it now. we had to take it out of the HO17 shelter, and then it took about a minute to fix.
all we need now is a w2 film ! cheers, alan

hello jim, my email is mohawk@.... we do have the scr399 manual , in fact two of them. we also have the PE95 one.
our PE95 was re wired for 220v in holland for use as a standby generator in a flower grower's.
it is 3 phase now, so we are using one for the bc610 via a transformer, and the other 2 for use around our camp when at vehicle shows. it will also come in handy for emergency use here.
when the stencilling is finished, i am going to take a photo and post it .
i remember the trucks well from the war, and we still have the little ladder which i "!iberated" !
it took me 60 years to get the truck to go with it .as i remember they used to paint characters from lil abner on the trucks, so we are going to do one of daisy mae. cheers, alan

From: Bry Carling
Topic: 4211  Message: 4211

Reduced even more.... some BC610 crystals need a new home:
(Type FT171B)

Someone is going to get a bargain here... if they don't sell this week I will
put them back into the regular bins.

Group 171-B - 3510, 3615, 3835, 3905, 3905, 3945 kHz - All 6 for $21.00
total. (normally $19.00 each)

Group 171-D - 3615, 3905 kHz - Two for $7.00 total.
(normally $38.00 for the pair)

I hope someone can use these. I have a bunch of other FT171B
crystals available for $19.00 each.

Shipping additional. E-mail me off the list please.

From: Alan Morriss
Topic: 4215  Message: 4215

hello guys, the mod level was very low in the bc610 , so i suspected the speech amp. i checked it over, and all that needed replacing was a couple of leaky silver mica caps.
now there is no modulation at all ! before , the mod plate current control needed to be set very high to get the 40 ma m now it does nothing.
i suspect the trouble was never in the amp but the bias was too high, and now it is at cut off point. could this be rl3 ? uf so, where is it , as the illustration is not clear.
cheers, alan g4gen

hello guys, the mod level was very low in the bc610 , so i suspected the speech amp. i checked it over, and all that needed replacing was a couple of leaky silver mica caps. now there is no modulation at all ! before , the mod plate current control needed to be set very high to get the 40 ma m now it does nothing.
i suspect the trouble was never in the amp but the bias was too high, and now it is at cut off point. could this be rl3 ? uf so, where is it , as the illustration is not clear.
cheers, alan g4gen

Alan,

The T-7 audio transformer is "infamous"for failure.

BTW, which model BC-610 is it?

Actually, silver mica caps of the vintage involved, are notorious for
their "migration" problem. that results in "leakage of voltage" at DC.

thanks for the info guys. my tx is an"E" model and in really good shape. the speech amp is the same.
the set up was given to the luxembourg army after the war, and used up to the lat sixties. it had been used by US forces in the ardennes offensive before that.
it has never been lying outside.
i checked the transformer first thing, and it seems fine. jan in holland from whom we got the scr399 told me where RL3 is, and is accessible by removing the tank coil. i never realised that that was the one. i am going over to belring soon to have a look at it.
the fact that the modulator bias control no longer has any effect seems to point that way. when you go to cw , as soon as the keyswitch is put to send the tx is energised without the key being pressed.
these things keep you from getting bored !! alan

hello guys, i have just spent most of the day at beltring trying to fix the BC 610. it is really hard working on it in the shelter.
so far no result . the fact that it goes on when placed to transmit in the cw position and the key has no effect must be connected with the problem.
it looks as though i will have to get it out of the shelter again, but the trouble is the difficulty in testing it then cheers, alan

hello les, i found out the cause of the exciter ht problem. once the tx was out of the shelter it took about 1 minute. the ground connection for the centre taap of the heater transformer for the rectifier had come adrift.the nut could never have been tightened properly.
however, once i got it on air the mod was low, and vanished completely. the mod bias control has no effect. max thinks that it is the lead from jb70 to the set. next job ! cheers, alan

Hi Alan,

Yes, that's possible. Does the mod come back when you put a mic direct into the BC-614? However, if the bias supply has failed you'll need to look into the circuit through the 614, as it meters the standing current on the 610 modulator. Simple enough job to ring through the 610 to 614 and the JB-70A to 614 cables. I don't have any experience on the JB-70A; I still have one but don't use it, use the homebrew station controller instead. It's just a pair of contacts on a heavy-duty relay, so you could substitute the JB by linking the right two pins on the 614 input, I have the info here if you need it.

Hi, This blurb appears at the bottom of this site
http://www.eht.com/oldradio/arrl/2004-04/April-2004.htm

"ER has a great article on rebuilding the BC-610 that just came out in issue #178, March 2004, by Bill Feldman, N6PY. It's 16 pages long, filled with photographs and details on how he brought this beauty back to life.

Other issues that have good BC-610 information in, are issues #126, #127 and #128.

You can purchase single (back) issues for $3.75 each, on line, on the ER Web Page. "

ER is at http://www.ermag.com/

I have several of the back issues on the HT-4 but not issue #178. Drat!

Hope this helps and hope someone close by can assist. I'm out in California.

Hi All,

I have recently started getting some of the ancillary equipment for my BC-610 back into working order. First up was the BC-342-N receiver and that is now working and on soak test. I would now like to hook the BC-610, 614 and 342 into the JB-70A junction box, which has been gathering dust for a few years.

For this I need, as a minimum, male plugs to mate with sockets SO205 and SO206 on the JB-70A. 206 carries 12 V battery power for switching purposes and 205 carries the BC-342 muting circuit. Nice to have would also be the male connectors to mate with SO201, the main AC power for the BC-610 and also SO209, AC power to the BC-342.

I've taken the part numbers of the sockets from page 68 of TM 11-281, the makers type numbers are listed there and the makers names on the next page. Bear in mind I need the mating male plugs for these sockets, not the sockets themselves. I'm guessing that these plugs and sockets are now obsolete but if anyone knows of a source I'd be grateful for the info.

Oh, does anyone have a mounting plate for a BC-312/342 receiver they'd like to sell/swap?

Question: I have two BC 610s and one JB 70. I work only AM with them. I have never hooked up the JB 70 . Is there any advantage to using the JB 70 if I only operate AM? Just curious. 73, John, K5PGW

Robert & Group,
Coincidentally Robert, I initiated current connector ads running in ER shortly after seeking your assistance for a connector. Found this guy in Internet and rest is history. Here's ad:
"FOR SALE: Military connectors are our specialty. Please call for availability and price. William Perry, 702 (rear) Beechwood Road, Louisville, KY 40207 _williamperrycompany@..._ (mailto:williamperrycompany@...) 502-893-8724, FAX 502-893-9220"
Cheers Sir,

David,

Yep. I've been doing business with Bill since the 80's. If someone contacts me for a connector and I don't have it, I usually tell them to call Bill, unless they are foreign, in which case I may do the calling.

Some of the connectors that Roger is looking for aren't the sort of thing Bill normally has. The only place I've found the smaller ones (the Hubbells) in recent years has been at garage sales. Same for the BC-610 AC line plug. Some of the numbers are still being made under the same old number. But they don't always fit. Diameter of current (since the 80's) production is larger than the black bakelite originals and doesn't fit into the recessed male on either the BC-610 or the RA-20. And the wall thickness on the newer ones is too thin to allow turning down the diameter in a lathe.

FWIW, as a general statement the several variants of the two-pole and three-pole twist-lock connectors (females) have the same guts. Only the slotted holes in the connector face are different. So if you find any of the old (smaller diameter) ones you can sometimes modify the face opening to fit the keys on the chassis males and use them. The current and/or voltage ratings are, in this case, only "administrative".

Hi Robert,

That's what I feared, the designs have altered or the connectors have just plain died out. To be fair, there's no real problem in changing the sockets for something similar, either modern or vintage, depends on what I have in the junk box. Also, the sockets are partially out of sight underneath the chassis of the JB-70A so what I use would be on show.

To the question of whether it's worth the effort of getting the JB-70A going, I have a homebrew station controller which I use with the BC-610 at the moment so I am really only using the 70A because I have one, it does give me CW sidetone which I don't have at the moment - but then I was brought up on key-clicks at radio college, so sidetone is a luxury!

Roger,

OK. I've no idea why but when all the plug makers switched from bakelite to clear and yellow plastic, the plug OD increased enough that it won't go into an old recessed mounting. The new one will fit an old male cable plug, and will fit the male surface mounted style. Just not the recessed one.

Phil at Fair says he has some plugs that will fit the AC input plug on the BC-610 but that they have some sort of flange that you have to cut off. So if anyone needs one of those, call Phil. He doesn't know whether or not he has the AC input cable plug for the large connector on the bottom of the JB-70 or not (he doesn't have a JB-70 to check against). I told him next time he finds a plug he thinks might be it to send me the dimensions and I'd check them against the chassis plug in a junker JB-70 I have.

Hello Robert. I usually use a Hammarlund HQ 150 or some other such as a SP600JX17.

I do have the matching receiver that was part of the original military station. I think it is either a BC 342 or BC 312. Looks like in great shape but I have never fired it up. It also appears to have all the necessary cables with it. I am in Montana so I can't look at it.

We plan to be at the Belton Hamfest first weekend in October  73, John, K5PGW.

Hello to all,have last night finished my work at the BC610E to get qrv in AM.It is impressive to see how it works in that mode.have a nice old SHURE 440 mike which plug fits to the Detrola speechamplifier.the quality of this old gear seems to me to be made for eternity.there was nothing to repair except of the connecting cable and much cleaning.
one question remains:why does the HV break so much down if the key is pressed?What can I do to repair or modify this?

If by "HV break so much down if the key is pressed" you mean that the high B+ drops when you key the transmitter, how much does it drop? In AM, there should be no high B+ until you close the PTT switch. In CW it's on all the time if the HV switch is up. Two things that could cause excessive drop on key down in CW are open bleeder resistor (49 years ago, an open bleeder almost killed me) and poor regulation in the AC supply. You should have a minimum of #10 wiring all the way from the entry breaker panel to the transmitter.

Howdy
You will need an A.C. input of 120 VAC that does Not sag when at full power.
The BC-610E want 115 VAC at approximately 35 amps. If it was an "H" or "I"
model you could run the HV to the pa on 220 and the rest on 110, or 115 vac.
and be fine.

I have just made some voltage measurements.
The idle mains voltage is 111,6 volts,
but on full load only 99,5 volts.
measure point was the speechamplifier.
but if I want to measure at the step down transformer (from 220 to 110 volts) the transistorised multimeter measures 0 volts and the old multimeter reads over 300 volts(instead of abt 110 volts).
I think there is a lot of HF on the mains line.
Sometimes my telephone rings when I am keying the old BC610 but there is no one calling me.
the HV reads idle 2950 volts on load 2300 volts.
I think I can improve the situation by shorten the mains cable and take a cable of greater diameter.I should try to get rid of the HF on the mains line.
the bleeder resistor is good,have controlled it at earlier times.

You should check the mains voltage at the PLUG where it gets
the power from the wall socket., and see if it is dropping the
same amount there. If it is then changing the cable on the BC610 will not
help.

You might need some heavier wiring in the house itself if that is the case.

hello guys, well, whenever i key my W/S 53 , which is the british successor to the BC610, the phone rings.
i was running the BC610 from our pe95 which has been modified for 220V . it was used as a standby power unit in holland. we have to use the same auto transformer which we use on the mains 230v.
i found that the voltage dropped to 95 , but the tx still worked with a reduced power. the bc342 however went dead and needed warm up time before coming on again .
we have given that idea up and i am looking for a 5kva variac. alan g4gen

Hi All,

Search over! Have located a base for the BC-342-N, along with the CH-121-A Chest it goes with.

Hi Alan,

Modern electronics aren't WS-53 or BC-610 proof, I'm afraid! I now have one of these new-fangled TVs with built in Internet, etc, Lord knows what will happen next time I fire up The Beast! No TX antenna at the moment so can't experiment.

Did you ever try that 117V auto-transformer you got from me? I'm not a fan of auto-transformers myself and use a yellow site transformer with the secondary centre tap removed but that only gives 110V on load of course. That ex-RAF lump was well-rated for a BC-610 I would think, if weight is anything to go by. It was used to run some American IFF gear that formed part of a RAF ground radar system, so you can be sure its conservatively rated.

The WS-53 sounded great this morning, as ever!

Check all of your neutral connections all the way to the meter socket, a loose one will show as reduced voltage.

I have just made some voltage measurements.
The idle mains voltage is 111,6 volts,
but on full load only 99,5 volts.
measure point was the speechamplifier.
but if I want to measure at the step down transformer (from 220 to 110 volts) the transistorised multimeter measures 0 volts and the old multimeter reads over 300 volts(instead of abt 110 volts).
I think there is a lot of HF on the mains line.
Sometimes my telephone rings when I am keying the old BC610 but there is no one calling me.
the HV reads idle 2950 volts on load 2300 volts.
I think I can improve the situation by shorten the mains cable and take a cable of greater diameter.I should try to get rid of the HF on the mains line.
the bleeder resistor is good,have controlled it at earlier times.

hello roger, yes we used it at first, but i found that the voltage was around 120 . we had a site transformer, and removed the centre tap. this does it a treat.
this is mounted in the chest of the pe95 when we use the scr399 at shows. the generator was re wired with two 220v stators giving 2 outputs. one of these drives the set and the other our gear .
trouble is that on load the voltage drops to 95 or just over. what i want is a 5kva variac.
cheers, alan

Hi Alan,

Well if there's a big voltage drop on full load it looks like the rewound PE95 with the two stators can't handle the required current and the Variac may not help, and you may find you have to constantly adjust it to meet the varying load. That 117V autotransformer will give you a little overhead if it runs at 120V, if it drops to 110V then you're better off than the site transformer giving you 95V. Was that 120V on load or off-load? Someone on the group quoted 40+ amps at 115V for the '610 on full whack, I'd guess with the conversion losses between 220 and 110 you might be needing a bigger genny? Where is your site transformer relative to the station, if the lead is too long you'll lose more power that way.

+hello rooger, we worked that out, and decided that we might find a setting where the voltage is within the higher limit, but does not drop too low. the tx seems to work ok with a slight power reduction on about 98 V. i think however that this is not too good for the big valves.
i am looking for a proper 110v generator. one day i will find one ! as things are, we ran it from a standard 5kva commercial generator and the transformer.
the one we got from you is too big to fit in the pe95.
all a bit academic though, as i still have not got any mod , the bias control does nothing, and on cw it is permanent key down.
max thinks it is the lead from jb70 to the tx. the end at the tx plug turns through 90 deg. when i get round to it i will check it for shorts and continuity.
at present the truck and pe95 are standing out in the park, so when we put it back in the shed i will have a go.

oh, i forgot to say, the transformer has a short heavy duty lead from it with one of the proper massive plugs on it which connects to the lead to the jb70. there is little loss. it works fine on a small 5kva gene.i would not think it takes 40 amps, as the mains lead for the transformer has a standard 13a fuse, and it has never blown. that would only represent 26a out. alan

Hi Alan,

OK, well looks like you have things in hand with the power, maybe a new 115V alternator attached to the PE95 motor may be the way to go?

Oh, I hadn't realised that that you had problems with the station, that's bad news and I hope it turns out to be a cable problem, that way you won't have to get the TX out of the shelter again. Certainly sounds like the BC-314 to 610 cable, any damage visible?

Brian, GW4KYT, has a FT-162 for me for mounting my BC-342 on and he has the whole Chest that it fits in (actually the Chest that the BC-312 goes in, but will be fine for the 342). Only problem now is getting it to Norfolk from Swansea!

Started work on the BC-669-C today, it's been down for months with a crystal oscillator fault but have that going now, now to look at the RX which is distorted on the higher band - hope to get it on-air for the nets during the autumn.

That BC-191 from Holland sounded great today, very strong with me of course but then he's got plenty of space for antennas at Schipol Airport!

Hi Steve,

Ah, the CH-120-A would have been my choice as I could put most of the equipment in that, but there aren't that many of these things around!

I've looked through the three TMs I have on the BC-610, etc but can't see any shipping weight for the CH-121-A. I'd like to get a shipping quote but need the weight to do that, can anyone help?

Roger,
I weighed the CH-120-A to be 95 lbs empty (and without legs). They compare in length 50.5 vs 31 inches or 61% so I get 58.3 lbs, empirically speaking.
73,
Steve

Steve (and Roger),

Actually I think it'll probably be closer to 65 pounds. Both chests have the same pair of ends and both have some at least of the same hardware. I didn't look up the other two dimensions in order to covert the ends to equivalent length but if you do that, subtract the weight of hardware common to both chests, do the relative calculation and then add back the hardware weight you'd get within a vew ounces.

I did check the CH-120 and CH-121 entries (and all suffix letter variants) in SIG 5 of 12/45. No weight given.

Hi Robert and Steve,

Many thanks for taking the time to check the weights for me. There is a speaker inside, plus the FT-162 but no legs, so I'll add/subtract a few pounds for those items. The couriers will mainly want to know if the chest can be moved by one man, for health and safety reasons, otherwise it gets complicated! I wondered if the weights were on the chest labels but the similar chests I have here, for the BC-669 and a teleprinter, don't show the weight.

hello roger, the original alternators are still around.after the war when the dutch flower industry was reviving a firm bought up loads of PE95s and replaced the stators for use to supplement the unreliable main supply for them. ours is one.
mike willenbroek bought up loads of them , removed the engines for sale to jeep owners and scrapped the alternators. he is looking for one for us.
i checked the bc 614 0ver, and only had to replace a couple of silver mica caps. it is in excellent shape.
you have a long drive to pick up the chest from wales, but it will be worth it. cheers, alan

Subject: [T-368_BC-610] Re: rf

Hi Alan,

OK, well looks like you have things in hand with the power, maybe a new 115V alternator attached to the PE95 motor may be the way to go?

Oh, I hadn't realised that that you had problems with the station, that's bad news and I hope it turns out to be a cable problem, that way you won't have to get the TX out of the shelter again. Certainly sounds like the BC-314 to 610 cable, any damage visible?

Brian, GW4KYT, has a FT-162 for me for mounting my BC-342 on and he has the whole Chest that it fits in (actually the Chest that the BC-312 goes in, but will be fine for the 342). Only problem now is getting it to Norfolk from Swansea!

Started work on the BC-669-C today, it's been down for months with a crystal oscillator fault but have that going now, now to look at the RX which is distorted on the higher band - hope to get it on-air for the nets during the autumn.

That BC-191 from Holland sounded great today, very strong with me of course but then he's got plenty of space for antennas at Schipol Airport!

Roger,

OK. The WW-II LS-3's weigh on average 10.5 pounds. The FT-162 3.9 pounds.

From: radiokid@ymail.com
Topic: 4273  Message: 4273

Hello to all!

have improved the mains power supply,primary voltage drops now only abt. 1 volt on 230 volts,secondary from abt 114 to 106 volts.(5 KW transformer to get 115 volts)
Plate current is 370 mA somewhat high at 2350 volts (idle now at 3200 volts).
Efficiency on 20m band is bad (abt. 30%), output at 250 watts.Is that normal for BC610 efficiency on 20 m band?Is the tube perhaps bad?
I have other PA-coils but output is same or rather less.
Who can give a hint?
I want to know some abt.the SC242A,about it's history in WW2.
Thanks to all for help.

73!

Hi All,

Are there any published mods for using an external VFO with the BC-610? I have a nice ET-4336 VFO module here I'm putting into service with my BC-669-C and it would be good to use it for the '610 as well.

Yes. And "official" at that. AN/TRA-7 was built (apparently, from TM dates) just slightly post-war for use with AN/MRC-2. And was carried over to the early AN/GRC-26 models. Frequency Shift Exciter O-39(*)/TRA-7 supplied the transmitter excitation. Output frequency was 2-6 MC. Brief perusal of several related TM's didn't turn up output voltage. But output buffer-amp was either 6V6GT or 6AG7 (depending on O-39 model).

O-39 was connected to BC-610 through 6' of RG-63/U (125 ohm). Terminated at exciter end with appropriate coax connector. Terminated at transmitter end with what I'll describe as modified FT-171-B holder. Shield of coax goes to right-hand pin of tuning unit crystal socket (looking from front of xmtr). Center conductor through 470 uuf/500 VDC mica capacitor to left-hand pin.

Cable installation instructions didn't say how the cable gets inside the 610 (i.e., xmtr mod instructions, if any, not mentioned). I would guess a grometted hole in right side of transmitter, hole large enough for coax plug.

Roger,

Back in the 16960's I did such a mod. Take an old metal shell tube, remove the base. Break open the internal glass envelope, cleaning it out real well. Drill a hole in the top of the metal shell big enough to mount a BNC connector. Connect a 47pF silver mica capacitor between the center of the BNC and the plate pin of the BC610's oscillator socket plate pin. Lastly, in the BC-610 you will need to wire the oscillator tube socket cathode pin to ground. Oh yes, I almost forgot: Connect the shell of the BNC connector to the cathode pin of the adaptor's cathode pin. If you do not want to have cables running out of theBC-610, mount a connector of your choice on the right side wall in a convenient location. Run the cable from the inside and terminate it in a BNC Male connector for connection to the top of your new adaptor.

I used several different oscillators (VFO's) with my BC-610 and they all worked well.

Good Luck,

Ed, KM4QQ

Not sure why one would want to do that, but audio could also be
brought in via J12 on the (lower) rear of the cabinet.

OK Peter,

That might be some kind of unit marking, maybe? I remember someone on this group saying that a lot of SCR-299s or 399s were left in Germany by the US military when they pulled out, as a sort of reserve equipment pool.

If it's small print and especially if it's red-orange, it's more likely a
QA Inspector stamp. The one I use is

SC
3585
A

From: Roger Basford
Topic: 4275  Message: 4284

Robert & Edward,

Many thanks for those mods and neither could be called invasive to the radio, which is good news. I already have an FT-171 xtal holder modified with a BNC socket, so it's just a question of checking which way around its wired. I will give both methods a try and see what works best for me.

Edward, I presume that earthing the cathode pin on the oscillator tube socket could be done with a link on the modified tube base you use to connect the VFO input? Probably a lot easier than going under the RF deck to modify the tube socket?

Thanks again!

Roger/G3VKM

Roger,

Yes, grounding the cathode pin in any manner will work. When I did it, I had the transmitter all torn down, and I put a jumper wire to the chassis underneath the chassis. I did not plan to ever go back and take the mod out. I can see where what you are proposing would work just fine. The reason for doing this is that there is an RF choke in the cathode lead which would cause a problem with proper operation if not bypassed. It is advisable to keep that jumper as direct and short as possible. I converted the BC-610 to a double-sideband suppressed carrier rig! I changed the final amp to 4 each 813's, removed the 250th and a bunch of other circuit changes. Ran about 1600 Watts on DSB. I sold the unit in Germany before I returned to the States after my first 3-year military tour there in 1968. If I ever get my hands on another 610, I will do me up another 610, better than the last one I did!

Later,
Ed, KM4QQ

In the late 40's 1947 or 48 there was a setup using the BC-221 freq meter with an additional buffer amp between it and the 610 tuning unit input.  Purportedly it worked well.

I didn't relate that marking to be related to any group or equipment.  it sounds to me more like some sort of acceptance marking from either the assembly line or some military inspector.  Surprised Robert D. hasn't weighed in on this.  Or someone else for that matter.

Is it in orange paint, white paint or what?

OK Peter,

That might be some kind of unit marking, maybe? I remember someone on this group saying that a lot of SCR-299s or 399s were left in Germany by the US military when they pulled out, as a sort of reserve equipment pool.

Well, I waited a while thinking someone else would probably make the same
or a similar comment.

I will add that in the Mine Force (underwater explosive ordnance), records
of who was formerly issued a particular QA stamp weren't kept very long.
Maybe 3 years. I would have to guess that the same was probably true in
other Commands. And the stamps themselves were often locally procurred. So the
odds of ever turning up lists of stamp assignments are probably slim to
none.

Hi Ed,

OK, that will be easy to try out; I didn't want to make any under-chassis mods that will have to be removed if I want to return to spec at some time.

hello guys, now that sounds really promising. i use my bc221 with the bc 610 with the standard vfo units.i work 80 metres cw with it and it raises no complaints.
does anyone have the details ? alan g4gen

In the late 40's 1947 or 48 there was a setup using the BC-221 freq meter with an additional buffer amp between it and the 610 tuning unit input. Purportedly it worked well.

Robert & Edward,

Many thanks for those mods and neither could be called invasive to the radio, which is good news. I already have an FT-171 xtal holder modified with a BNC socket, so it's just a question of checking which way around its wired. I will give both methods a try and see what works best for me.

Edward, I presume that earthing the cathode pin on the oscillator tube socket could be done with a link on the modified tube base you use to connect the VFO input? Probably a lot easier than going under the RF deck to modify the tube socket?

Thanks again!

Roger/G3VKM

Hi Ed,

OK, that will be easy to try out; I didn't want to make any under-chassis mods that will have to be removed if I want to return to spec at some time.

Alan,

The VFOs I used with my BC-610 had the capability of being keyed. If one is used that isn't keyable (The BC-221) comes to mind) It has a switch that allows it to be placed in standby. Those switch positions can be accessed and a small relay used that is switched by the station change-over relay system.

hello edward, that was what i thought you would have to do. mostly i used an xtal though. all i now have to do is to find the fault , probably in the connector fron jb70, and i will be on air again. i will try that bc221 idea.

Hello Roger,
I plead for direct improvements of the tuning units of the BC610,it's possible with modern techniques and includes voltage- and thermal-stabilization,adding bandspreads.So the appearance would be close to original and no external "boxes" are needed.
I did so and it works great,it's a pleasure to be on the air with this old transmitter.QSO partners told me,it sounds like a modern day transmitter(CW-mode).

There is an article in the 11th Edition of the Radio Handbook (1948) on a BC-221 based general purpose VFO. Essentially a BC-221 mounted on a larger chassis with a power supply and a buffer amplifier. The latter was a three stage affair, two untuned 6AG7s followed by a tuned 6L6 with link output. One hundred-fifty volts regulated on the 6AG7s and 300 on the 6L6. The article claimed that tuning the 6L6 stage to the middle of the "3.5 megacycle band" (i.e., 3.75mc) provided constant output across the band with no further adjustment.

Looks like a bit of overkill to me. Can provide circuit of the buffer amp on request.

I'd be grateful for a copy of the buffer amp.
Thanks!

Regarding using the tuning unit for a VFO, I found the manufacturer of the oscillator tube to result in varying amounts of drift. RCA 6V6's had the least drift and that the greatest amount occurred during the first 5 minutes of operation due to thermal stabilization. If a way was found to bias the oscillator tube into a non-oscillator class during receive then the tuning unit would perform as a VFO in an acceptable manner.

I found it advantageous to let the oscillator tube oscillate all the time,during receive to add by a little relay a small fixed capacitor so that its frequency is beside the receiving frequency.this results in less drift and reception is undisturbed.

In the late 40's 1947 or 48 there was a setup using the BC-221 freq meter with an additional buffer amp between it and the 610 tuning unit input.  Purportedly it worked well.

Robert & Edward,

Many thanks for those mods and neither could be called invasive to the radio, which is good news. I already have an FT-171 xtal holder modified with a BNC socket, so it's just a question of checking which way around its wired. I will give both methods a try and see what works best for me.

Edward, I presume that earthing the cathode pin on the oscillator tube socket could be done with a link on the modified tube base you use to connect the VFO input? Probably a lot easier than going under the RF deck to modify the tube socket?

Thanks again!

From: John Page
Topic: 4275  Message: 4303

John Page K4KWM Hollow State since 1953 (ex W8PKU,N8BLB,NA8O)

I have a very nice T-368C for sale. It came from K8TV and has all the approved mods. RF and audio. I have an extra VFO and a box of extra tube including final and mod tubes. Also a large step down transformer for 220 to 110 useage. I am in SW Ohio and it is pickup only.

Asking $1200

John

The article that shows and describes the using of a BC-221 as a VFO for the BC-610.  I've even got a copy of it around here someplace.  What they did was build a buffer amp to follow the BC-221 which in turn then drove the XTAL socket input on the tuning unit.  1947 or 1948 was the timeframe on the article.  Coule probably do the same thing if you had an LM type freq meter.

those little stamps are in orange paint in a triangle of same colour, not very durable.may be from some military inspections,seems not to come from the manufacturer.

OK. They are Signal Corps QA stamps. No particular meaning to the letters and numbers other than SC is Signal Corps. And the numbers ID'd the person the stamp was issued to at the time that the stamping was done. Could have been applied at the factory or at the Depot that had ordered the equipment (i.e., either acceptance or receipt inspection.

Hello!looking since 2006 for a bias transformer for my BC610E.If somebody has one in surplus,he possibly can keep it for me until there is a chance to ship it?No urgent matter,have made a homemade replacement,which works excellent.

Hi Peter. You might be well off if you keep the sub. since the exact replacement will be old and subject to opening or shorting as the original. I have done the same as you with the exception of removing the drivers 2A3s and triod connected a pair of EL34 works beautifully....chance thecathode resister....jst thought you might be enterested in my experence. # 4311. BC-610I

Yahoo group: T-368_BC-610
Date: 2010-09-15 00:08:35 UTC
From: Chuck Hurley
Topic: 4311  Message: 4311

My BC-610I was recently restored. The high voltage relay does not always pull in cleanly. At times it chatters and eventually it will work. I have tried adjusting the tension on the relay but it seems not to have any effect. What causes this relay to violently chatter at times?

Thanks
Chuck K1TLI

may be that the contacts of RY2 must be cleaned,you find it after removing the backcover on bottom chassis at the right,its marked RY2.it is easily accessible after removing the relay cover,the idle contact is responsible here.cleaning with very fine sandpaper and cloth.may be the contacts of switch SW6 are dirty,is not so easily accessible.check the resistance of the coil of RY1 abt 160 ohms.when all switches are in off position you can test the relay RY1 by directly applying 115V to the coil.
!!!Take great care when repairing your transmitter!!!
good luck!

maybe the voltage is dropping on transmit. this can happen if the cable is too small in diameter.try putting a meter across it. alan g4gen

Yahoo group: T-368_BC-610
Date: 2010-09-19 17:47:41 UTC
From: Chuck Hurley
Topic: 507  Message: 4314

Alan,

By "cable is too small" which cable do you mean?

I have found that if the cover over the relays is removed and the back panel loosened up and pryed out slightly, the relay pulls in fine. As you move the back panel closer to the case the relay starts to chatter. Magnetics?

The relay works cleanly if the cable to the BC-614 is removed. It then keys cleanly from the front panel plate switch.

Some kind of feedback loop?

Thanks

hi, i meant the mains 110v lead. this has to take a heavy current. when you displace the back, the safety micro is broken so that you cannot get the eht on . this means that the transformer is not taking current so the voltage drop would be much less. try a meter across the mains socket at the rear. you will have to put a couple of wires from it. be very careful if doing anything when there is maiins voltage on the tx. it can easily kill you if you get the 2500 v. always keep one hand in your pocket. i got a shock from stupidity , having bypassed the safety interlock. i touched the tank coil. i will never repeat that ! ! cheers, alan

Check the HV wiring near the 3B28's very carefully for cracks, etc.  Check the spark gap on the caps under the power supply deck.

# 4319. ET4336 VFO

Yahoo group: T-368_BC-610
Date: 2010-10-03 11:21:07 UTC
From: Roger Basford
Topic: 4275  Message: 4319

Hi All,

Is there anyone on the group with any info on calibrating the RCA ET-4336 VFO? This the unit I am intending to use with my BC-610, BC-669, etc as an external drive source. My VFO is working well but I cannot seem to get the required swing in frequency across the fundamental range, the swing is too great. The only adjustment seems to be the position of the contact wheel on the grid tuning roller-coaster.

Any info appreciated,

Roger/G3VKM

Roger
Very early in my career, I was an engineer for RCA-Radiomarine. I think the number you gave was the same VFO that RCA used for their MHF-HF marine radio telephone/ telegraph consoles, in the pre-
X-tal days. IF! it is what I think it is, it should be a near copy of the BC-221 frequency meter. IF! I

remember correctly the freq range was roughly 1990KC to 4010KC. If you can send a picture of it,
it might jog my memory some.

From: Roger Basford
Topic: 4275  Message: 4321

Hello Ray,

The ET-4336 is actually the whole transmitter, it plugs into the TX as a screened module. The VFO is based on an 807, with grid tuning done by a roller-caster and anode multiplication by a second roller. The RCA 4331, 4332 & 4336 were Lend-Lease radios, probably they were a lot more over common here than the BC-610.

There was a set of mods published here around 1949 making the VFO into a stand-alone low-power TX, which seems to have been popular and I've removed those mods from mine. So, I think your description is certainly of a different unit. Will try and up load a couple of grabs from the manual to the Files section.

Thanks,

Roger/G3VKM

# 4323. FS: Two BC610 crystals for 80m

Yahoo group: T-368_BC-610
Date: 2010-10-04 11:51:53 UTC
From: Bry Carling
Topic: 4323  Message: 4323

FOR SALE: Two original BC610 crystals for 80m band.

These are the larger old crystals in the FT171B cases... 3/4" pin spacing
and a handle on top.

One is on 3615 kHz, and the other one is on 3905 kHz.
Good working condition.

Will sell as a pair only - for $20.00 plus shipping.

(normally sell for $19.00 each)

Contact via e-mail: bcarling@...
or check the other crystals at my web site:

http://www.af4k.com/FT171_crystals.htm

http://www.af4k.com/crystals.htm

Subject: [T-368_BC-610] Re: ET4336 VFO

There is now a pair of files on the site called "VFO", Ray. Those show the two side views of the VFO.

# 4325. FS: UTC S-70 Filament Transformer

Yahoo group: T-368_BC-610
Date: 2010-10-04 18:54:58 UTC
From: Bry Carling
Topic: 4325  Message: 4325

FOR SALE: UTC model S-70 Filament Transformer.

Classic gray potted upright style transformer with the beveled corners.
Lightly used and in good working condition. These vintage UTC
transformers typically sell for around $100 each on eBay.
Here is a guy selling a pair of rusty ones for $259.00 - item # 310154251173

Primaries:
105 and 115V AC

TWO Secondaries:
Each is 6.3V c.t. at 5 Amps

PRI:1500V HIPOT
SEC:3000V HIPOT
CT 6.3V 5A x2
50~60Hz

Dimensions: 4-1/2" X 3-1/8" X 3-7/8" tall with four ears that
have mounting holes.

QTY 1 available for $35.00 plus shipping.

# 4327. FS: AM & CW ops - Nearly Free, old FT243 crystals

Yahoo group: T-368_BC-610
Date: 2010-10-08 22:19:19 UTC
From: Bry Carling
Topic: 4327  Message: 4327

FOR SALE:

Groups of original old FT243 crystals. Great for experiments
needing some reliable WW2-era rocks for those who prefer them.
Hard to beat and hard to find. They just need a home!

GROUP 6 - SIX (6) FT243 crystals - original ones on
7125, 7140, 7206, 7200, 7202, 7243 kHz
Available for just $6.00 total for all six plus shipping.

GROUP 7 - SEVEN (7) FT243 crystals - original ones on
7125, 7140, 7173, 7229, 7242, 7274, 7291 kHz
Available for just $7.00 total for all seven plus shipping.

GROUP 8 - EIGHT (8) FT243 CRYSTALS - original ones on
7125, 7140, 7167, 7205, 7221, 7248, 7291, 7297 kHz
Available for just $8.00 total for all eight plus shipping.

You can order directly on line. Or e-mail me.

Many other ham band FT243 crystals, new and old available.
See:
http://www.af4k.com/basementcrystals.htm
http://www.af4k.com/crystals.htm

# 4328. Nearly Free Ham Band Crystals II

Yahoo group: T-368_BC-610
Date: 2010-10-11 12:59:27 UTC
From: Bry Carling
Topic: 4328  Message: 4328

Thank you to everyone who responded about the groups of crystals.
They were all sold. I have a few more if anyone is interested, great
for homebrewing and experimenting "AM CW delight" - as follows:

(these will only be sold as groups)

GROUP 1 - hc16 crystals on: 7174, 7185, 7200, 7212, 7244 kHz
Available for $5.00 plus shipping

GROUP 2 - hc16 crystals on: 28444, 28444, 28555, 28735, 28785, 28866,
29011, 29444 kHz
Available for $8.00 plus shipping

GROUP 3 - FT243 crystals on 7073, 7100, 7125, 7140, 7175, 7200, 225,
7244, 7275, 7286 kHz
Available for $12.00 plus shipping

GROUP 4 - FT243 Crystals on 7075, 7100, 7106.7, 7125, 7140, 7173,
7175, 7224, 7275 kHz
Available for $12.00 plus shipping

GROUP 5 - FT243 Crystals on 7073, 7125, 7125, 7140, 7151, 7174, 7175,
7200, 7225, 7300 kHz
Available for $12.00 plus shipping

Contact me off the list via e-mail please...

73 - Brian, AF4K

# 4329. FS: Large box of Cinch-Jones Connectors

Yahoo group: T-368_BC-610
Date: 2010-10-16 19:30:12 UTC
From: Bry Carling
Topic: 4329  Message: 4329

FOR SALE: Box of Cinch-Jones Connectors

Approximately 90 pieces, everywhere from 2-pins to 15 pins.
Some are cable-end types, others are chassis mount. Many are
in pairs (M-F) - many of these parts are new, several are used, but all
are in great shape, and they come in very handy around the ham shack.

Will sell the entire box for $40.00 plus $12.00 for USA shipping.

73 - Brian, AF4K

# 4330. FS: Ham Homebrewing parts

Yahoo group: T-368_BC-610
Date: 2010-10-29 19:52:39 UTC
From: Bry Carling
Topic: 4330  Message: 4330

FOR SALE:

NEW IN BOX FT243 Crystals on 1030 kHz - $5.00 each (QTY 10 available)

NEW IN BOX FT243 Crystal on 1475 kHz - $5.00 (QTY 1 available)

GROUP OF SIX panel mount fuse holders - traditional cartridge fuse sizes.
various shapes, but all pretty standard. All for $6.00 plus shipping.

RCA 6197 tubes - QTY 4 available. New in boxes. $2.00 each plus shipping.

RCA 5651 tubes - QTY 2 available. New in boxes. $2.00 each plus shipping.

Sylvania 5963 tubes - QTY 2 available. New in boxes. $3.00 each plus
shipping.

JUNK BOXES (!!) - may include caps, power supplies, tubes, resistors,
plugs,
adapters, crystals, variable capacitors, fuses, hardware etc. These will fill a
medium sized Priority mail flat rate box to USA for $15.00 plus $13.00
shipping.
Easily worth at least $60.00 by anyone's reckoning.
QTY 4 available for $15.00 plus shipping.

HIGH Voltage terminal - plug and socket for panel mount of up to 5 KV
cables to RF PA etc.
QTY 1 available for $2.00 plus shipping.

PAIR OF special UHF diodes - type 1N21B as used in microwave
applications and prized by
crystal set builders. Will sell the pair for $5.00 plus shipping.

BOX of ten air variable capacitors with 1/4" shafts. Various PFs. Mostly
medium - low power
devices and most will be max of about 20 pf to 300 pF.
Will sell all for $20.00 plus shipping

STANCOR P-8359 p[ower transformer, new in box.
117V at 60 Cy. primary, SEC = 12.6V CT at 3.0 A
Available for $6.00 plus shipping

Pair of No. 20 ceramic standoffs by EF Johnson, conical, with two screw
mounts.
Height is 2". Width is 1-5/8" - has stud-nut and solder tag terminals on top.
Will sell the pair for just $4.00 plus shipping.

Group of TEN type CR-1A crystals from WW2 - most are not in the ham
bands - a few may be.

Will sell as a group for $10.00 plus shipping.

GROUP of TEN type FT243 Crystals WW2-era original types in the 40 meter ham band.
FREQs = 7000, 7075, 7100, 7125, 7140, 7173.3, 7175, 7185, 7222, 7275 kHz
A great value at $20.00 plus shipping for the entire group. (normally $14 each!)

PAIR of RF Chokes. 2.5 mH multi-pile types as typically used in low level transmitter stages or
in receivers, about 1" long X 1-1/2" diameter pilings, plus length of leads attached. Good,
used condition. Will sell the pair for $4.00 plus shipping.

QTY 4 new Octal sockets, with ground tags. Will sell all four for $6.00 plus shipping.

QTY 4 used Octal sockets, with ground tags. Good condition. Will sell all four for $4.00 plus shipping.

QTY 4 new LOCTAL sockets. Will sell all four for $8.00 plus shipping.

hc6u Crystal Sockets, ceramic - available for $4.00 each or FOUR for $12.00

QTY 8 - Phenolic, NEW 5-way terminal strips. Traditional turret style, great for homebrewing.
Dimensions, 2-/12' X 1/2" with 5 turrets. Wrap, solder, bingo, perfection. 2 sets available.
Will sell group of 8 for $16.00 plus shipping.

CS-137 crystal case from WW2 era. Good condition. Has been painted a darker green but still quite usable and in good shape.
Holds QTY 120 type FT243 crystals. Available for $15.00 plus shipping.

Combine items to save on shipping costs.

73 & thanks for looking - Bry, AF4K

FOR SALE:

QTY 14 Tube-era transformers.
These are mostly open frame, above-chassis type transformers w/lugs.
One or two potted, includes output transformers, power transformers etc.
Some marked, some pot-luck.
Will sell all 14 for $25.00 plus $11.00 for USA shipping.

JUNK BOXES (!!) - may include caps, power supplies, tubes, resistors, plugs,
adapters, crystals, variable capacitors, fuses, hardware etc. These will fill a
medium sized Priority mail flat rate box to USA for $15.00 plus $13.00 shipping.
Easily worth at least $60.00 by anyone's reckoning.
QTY 2 available for $15.00 plus $12.00 for USA shipping.

Paper capacitors, QTY 30 new, old stock caps with axial leads for
$3.00 plus shipping

Electrolytic capacitors, QTY 30 new, old stock caps with axial and radial
leads for $3.00 plus shipping

New RF Chokes, 2 mH pi-wound types with axial leads - rated 50 mA
Available for $2.00 each

New RF Chokes, 1 mH pi-wound types with axial leads - rated 50 mA
Available for $1.00 each

GROUPS of original ham band, 1945-1960 era FT243 crystals:

GROUP A:
QTY 5 - 3835, 3858, 3910, 3931, 3952 kHz
All for $15.00 plus shipping

GROUP B:
QTY 5 - 3878, 3891, 3940, 3945, 3990 kHz
All for $15.00 plus shipping

GROUP C:
QTY 2 - 3825 kHz
Pair for $10.00 plus shipping

GROUP D:
QTY 2 - 3840 kHz
Pair for $10.00 plus shipping

GROUP E:
QTY 2 - 3897 kHz
Pair for $10.00 plus shipping

GROUP F:
QTY 2 - 3995 kHz
Pair for $10.00 plus shipping

GROUP G:
QTY 2 more - 3995 kHz
Pair for $10.00 plus shipping

NEW IN BOX FT243 Crystals on 1030 kHz - $6.00 each (QTY 8 available)

100 kHz Calibrator Crystals HC13/U (TALL HC6U )
- $19.00 each plus shipping.

Other FT243 crystals: 1430, 1470, 1525, 1585, 1600, 1700, 1790 kHz
1815, 1822, 1825, 1843, 1850, 1856 kHz FT243 crystals - $14.00 each

QTY 1 - FT-243 crystal case, military surplus, type CS-137 with two locking compartments. Holds up to 120 crystals. QTY 1 available for $15.00 plus shipping.

GROUP OF SIX panel mount fuse holders - traditional cartridge fuse sizes. Very standard for homebrewing and repairs. All for $6.00 plus shipping.

QTY 4 Octal tube sockets. These are clean, used sockets.- standard type with ears for chassis mounting. All four for $4.00 plus shipping.

RCA 6197 tubes - QTY 4 available. New in boxes. $2.00 each plus shipping.

RCA 5651 tubes - QTY 2 available. New in boxes. $2.00 each plus shipping.

Sylvania 5963 tubes - QTY 2 available. New in boxes. $3.00 each plus shipping.

# 4333. T-368E Vacuum Variable Needed

Yahoo group: T-368_BC-610
Date: 2010-11-18 15:49:20 UTC
From: Harold Hairston
Topic: 4333  Message: 4333

The Plate Tuning Capacitor, C-6, in my T-368E is breaking down. I need two things. (1) Specifacations on this Vacuum Variable. I know that is probably 500 mmf but need to know Model #, manufacturer,etc in order to start looking for a replacement. (2) Any info as to where I may locate a replacement. I have tried Fair and SSN. Thanks for any help.

# 4334. BC-610 Serial number locations?

Seasons greetings to all.

While a S/Sgt at a stateside base , i was directed by a punk Lt. to change a pair BC-610s around, from one GRC-26/X vans to another, cause by serial number they were in the wrong vans. On shift with one other person , and he wanted the two of us to move two xmitters, about 20 ft. by the end of the shift ! he ( the Lt. ) showed up about two hours later,
checked serial no`s, said nothing, nodded his head and left the scene of the crime.

Yes, i changed tags ! one said bc-610 I , and the other said T-213...
always wondered if these two xmitters made it to the ham scene,and if they caused anyone grief?

73`s and the 610 is a better xmitter then the T-368...IMHO...

I saw that one coming!

No, the reason I ask is that my -E model came with a -D serial number plate, possibly as the transmitter was built up from parts of other sets or what, I don't know. But I thought that there might be another part of the transmitter that was marked, something like the PSU deck.

On the subject of "talking" mod transformers, I haven't heard this with my '610 but I did have a Labgear LG-300, a British-made 1950s TX that has a pair of 6146s modulating an 813. This had chronic talk-through, so bad that I eventually had to swap the mod transformer for a Woden UM2 type. Only just fitted in the modulator deck but cured the problem.

All the best for Xmas/2011.

# 4343. FS: Crystal Pairs

Yahoo group: T-368_BC-610
Date: 2010-12-14 14:06:51 UTC
From: Bry Carling
Topic: 4343  Message: 4343

FOR SALE: FT243 Crystal Pairs

One for you - one for a friend

QTY 2 X 3825 kHz

QTY 2 X 3897 kHz

QTY 4 X 3995 kHz

These are all available for $4.00 per crystal plus shipping.
Please contact me off the list.

73 - Bry, AF4K

# 4344. FS: Some more radio parts

Yahoo group: T-368_BC-610
Date: 2010-12-14 14:37:04 UTC
From: Bry Carling
Topic: 4344  Message: 4344

FOR SALE:

1)  BOX of 10 Ceramic Variable Capacitors. Various values from 30 pF and up. Some transmitting, some receiving. All ten for $20.00 plus shipping.

2) 100 kHz crystals - new, tall type hc13u calibrator crystal as used in all tube era radios. FIts the same soicket as an hc6u crystal. Available for $19.00 each plus shipping.

3) Lacing cord for wiring harnesses. New, 300 yard spool available for $12.50 plus shipping.

4) Pair of 2E26 transmitting tubes. Used, good tested tube pair for $5.00 plus shipping.

5) EIMAC 4-65A transmitting tube with ceramic socket in excellent condition. QTY 1 available for $8.00 plus shipping.

6) RCA 832 mil-spec transmitting tube - looks new.
QTY 1 available for $5.00 plus shipping.

7) G.E. 6997 VHF transmitting tube, used. Looks OK.
QTY 1 available for $2.00 plus shipping.

8) Drake Crystal for R4A, R4B or R4C, covers 10.0 - 10.5 MHz
QTY 1 available for $12.00

9) Group of hc6u crystals on 7000 kHz, 7100 kHz, 7159 kHz, 7170 kHz, and QTY 2 X 7174 kHz. TOTAL of six mil surplus crystals for $12.00 plus shipping.

10) Pair of FT243 crystals on 3880 kHz. One for you and one for a friend! These are available for $10.00 each plus shipping.

11) Broadcast band FT243 crystals.  1200 kHz, 1300 kHz, 1475 kHz, 1600 kHz, 1585 kHz. Available for $14.00 each plus shipping.

73 and thanks for looking.

> 73 Gene
>
>

95% chance that you weren't. the older non-potted transformers had
laminations that would 'sing' to you.

some of that comes from the transformer, some comes from the tubes,
themselves.

Some of it might even come from drawing the final current through the
secondary of the transformer, instead of shunting the DC voltage around
the secondary through a Modulation Reactor (non-swinging choke) and
capacitively couple the Audio to the DC line.

If anyone is interested in doing this, you need (to be safe) at LEAST 2x
the maximum voltage peak for the ratings on the capacitors, and for the
reactor, around'ish 8 Hy per 1k Ohm of Z (impedance) in the final.

ie: you're running 2kVDC on the plates, and 250mA.

Z = AC Resistance, so for all practical intents and purposes, substitute
Z for R in Ohms Law.
Z = 2kVDC divide by 250mA
Z = 8,000 ohms.
8000 ohms times 8 Henry's per 1000 ohms
Reactor size = 64 Hy @ (at least) 250mA.
4 or 5uf caps at 2x the max modulator output should be sufficient.

this way, the core of the modulation transformer isn't saturated, the
Hysteresis line is more linear and there's less distortion and
cross-over harmonic distortion in the audio. Positive peaks are
cleaner, ergo the entire signal is cleaner -and- the extra benefit of no
more talking modulation transformer.

73 = Best Regards,
-Geoff/W5OMR (/m, Baja Spring, TX)

Having heard of the problems with some of the BC-610s, It really isn't a "common" issue. I've only heard of complaints from one or two owners.

If Jim, WB2FCN chimes in, we may get a better idea as to the likelihood of the issue popping up. He used to run them in Europe and a few other places.

It is simply individual opinions. I don't know that it is "objectively" determined.

It is like asking the "notorious" which XXXXXX is the BEST?

The discussion goes on for days.

But opinion being what it is, to each their own. Both are wonderful transmitters and the BC-610 has a black wrinkle paint job and pre-war art deco styling that give it more of a 'radio' look.

# 4354. Re: [T-368_BC-610] WAS BC-610 Serial number locations - NOW T-368 VS BC-610

Yahoo group: T-368_BC-610
Date: 2010-12-16 16:47:15 UTC
From: rbethman
Topic: 4334  Message: 4354

It is comparing apples versus oranges!

The BC-610 was already being commercially produced when the Army Signal Corps went to Bill Halligan. The T-368 came out a good bit later.

The BC-610 fit the bill, "niche", if you like, at the required time and date. The intended use was to transmit distances of about 100 miles. They most likely didn't do a whole lot of frequency changing.

The time and history changed around THEM. The T-368 was probably contracted based on the use of the BC-610. I DO know the BC-610 was upgraded to the T-213 in one example that I own, and it was done in Depot dated July 1959.

It was then crated for shipment. The history has come out that WA5CAB, Robert Downs, and K5JV, Lon Cottingham managed to keep this particular one from being taken out to sea and dumped.

Ultimately I became its home.

I digress, the T-368 obviously came out and took the place of many BC-610s. R-390s or R-390As took the place of many of the old GRC-26/SCR-399 receivers.

If given the choice between either a T-368, with its band-switching capability, or the BC-610 with its need to change the PA coil and also possibly the Tuning Unit(s), I'd choose the T-368.

That wasn't the option that came upon me when obtaining the BC-610. So it really doesn't matter.

hello guys, the british army developed the Wireless Sender no. 53 to replace the BC610 . like the T369 is much better, band changing is easy, it has a stable and accurately calibrated vfo, and the PA and ant. loading circuits are variable inductors. it also has an excellent internal speech amplifier. i would not part with mine for any money. however, and this is important, the BC610 has something. i love mine , and sitting in the shelter operating it brings a tremendous satisfaction. i wonder what anxious traffic was passed through it during the ardennes offensive. apart from anything else, it looks like part of a flash gordon set ! alan g4gen

The only REAL difference between BC-610 and T-368 is technology
advances. From 250TH to 4-400A, or which the 250TH is the sturdier tube!!!!!
As for the speech anp conundrum that is just a matter of position and
additional usage.
Ie; the BC-614 was designed to sit on top of the SYSTEM control box JB-70,
the
tube line-up changed the chassis got smaller and was placed inside the
T-368, the power
control for the system, on the BC-610 is the JB-70. routes power and audio
and such,
on the T-368 system AN/GRC-26 the box is the C-1123 which does the same
function.
Some of which is route audio from a land-line telephone (TA-312) to the
radio set for
remote control of transmit/receive from a Communications center (Forward)
over WD-1
Wire pair in Both cases.

There are folks that swear the T-368 is better, however comparing them side
by side I
found no appreciable difference in the two sets. In fact most of the people
that "SAY"
the T-368 is better never owned or operated the BC-610 in a FULL system
configuration.
I might also mention both systems would operate over 2 wires to perform
their designed
function, which was to communicate.

Some folks have removed the T-368 speech amp and added external boxes to
make it
sound (to them) like a broadcast transmitter, which it doesn't, as listening
is a matter of
difference depending on who is doing the listening propagation etc;

You Mileage may vary, but to end the argument get one of each "SYSTEM" put
them
side by side on same antenna system and I'll give you a Dollar if you can
tell the difference
between rigs, "NOTE: that's two systems complete per the manuals"

Here ends the LESSON!
Jim WB2FCN

Hello again,
Folks are comapring apples and oranges. Neither transmitter was designed for Broadcast quality, but for COMMUNICATIONS QUALITY which is MORE important in battlefield usage. If you want "Broadcast Quality" buy a BROADCAST Transmitter!

As for the BAND CHANGE ISSUE, The efficency of the BC-610 is proved out by the POWER OUTPUT of the unit, a coil set optimized for a segment will always be more
efficient than a Multi-band switch-able section, Tuning across several bands takes a little longer
but the efficiency is there as the power levels can be optimized for the segment of the bands you are using!

I have and used both the 610-E as configured for the SCR 499 and T-368-E. I have enjoyed using both and appreciate the attributes that each have. For me , servicing the T-368 is easier than the getting into the 610. IMO I think the T-368 copied WS 53 with compartment sections that can provide easier access to do servicing when needed.

That might be true on paper, but 4-400s don't suffer the gassy or brittle filament issues of many NOS 250THs, made with lower grade materials due to war time shortages. And the technological advances are the basic point of my comments.

Precisely. You reinforced my original point, there is no need for a separate speech amp with the T-368, or a collection of coils, or tuning units. Position and additional usage no longer require consideration or attention. An advancement.

> There are folks that swear the T-368 is better, however comparing them side

> configuration.
>

And likely, few have an interest in doing so. The typical ham looking for either model wants a reliable, easy to tune transmitter with moderate output for AM and possibly CW use. "Better" from a matter of opinion is difficult to argue. I like my tube gear better than solid state gear for the experience it gives me of using a real radio. "Better" from a standpoint of engineering and technology involved is another matter, and easier to decide. It has nothing to do with preference and everything to do with actual utility and functionality.

> Some folks have removed the T-368 speech amp and added external boxes to
> make it
> sound (to them) like a broadcast transmitter, which it doesn't, as

> is a matter of
> difference depending on who is doing the listening propagation etc;
>

Some have also gutted and rebuilt the BC-610 to use different/more available PA tubes, or to expand its coverage. Not something I agree with, but it happens. That doesn't make the T-368 better anymore than mods to the T-368 make the BC-610 better.

> You Mileage may vary, but to end the argument get one of each "SYSTEM" put
> them
> side by side on same antenna system and I'll give you a Dollar if you can
> tell the difference
> between rigs, "NOTE: that's two systems complete per the manuals"
>

That certainly wasn't the intent of basis of my comments, Jim. Nor can I disagree with someone's opinion beyond preferring my own. Merely the obvious fact of the advances between the earlier BC-610/HT-4 and later, more advanced T-368 (which has its own limitations including stock frequency coverage). "Hearing" takes place at the receiving end. You can use a Flex radio and sound great. Operating takes place in the user's location, in which case the T-368 is likely the better fit for the vast majority not looking to re-create a complete system or relive a certain them/time. Plug it in, add an aerial, load it up and go. No coils or tuning units to track down or swap. No gassy 250THs with brittle filaments to deal with (I've yet to have a 4-400 crap out or be bad out of the box).

> Here ends the LESSON!
>

Well, you've got far more experience with the BC-610 than I have Jim, and I understand your affection for it. You provided me with assistance through tips and information when I had my E model. But from my original comments on technical and utility aspect, and also based on today's usage (hams using complete systems vs. stand alone transmitters), I stand by what I said. I've had both, the BC-610E is gone and the T-368D remains. I wouldn't get another 610 as the T-368 runs circles around it for amateur use. However, I might entertain a pre-war HT-4 at some point for exactly what it is: a 1930s style, plug-in coil transmitter whose looks and design provide an opportunity to enjoy a different kind of experience from the days before band switching as we now know and enjoy it.

They're two different transmitters, built at different times. One came from a civilian equivalent to fill a wartime need and the other was a purpose-built military transmitter (which at least explains the difference in overall looks). Whatever you've got, use it and enjoy it. 'Best' is what you make it, and having it on the air trumps most everything else.

From: Alan Morriss
Topic: 4360  Message: 4360

you are right about the 53 it is easy to work on. all connectors plug in at the front, and the 3 units slide out easily .you need help with the power one though ! the power output is lower, at 350 w cw and 250 phone. it uses a pair of 813s. the audio quality is up to broadcast standards, as part of the spec was to act as a local radio station after the invasion. however, the BC610 has beautiful audio, and using triodes must contribute to this. as was said, they are different , and the charm of the BC610 is the pre war aura. alan

Good question.

I've never owned one but I do own a T-368, and I can tell you it's built like a tank, it's fully band switching, the BC-610 is not, that seems to be a big draw back. i would not mind owning a BC-610, but I would not trade my T-3 for one. Wikipedia says that the BC-610 is "Self Powered" I guess it had a small Nuclear reactor inside, or perhaps a Ion drive.

Dave,

That is one of the "flaws" that turns up in "Wikipedia" from time to time.

The "only" method of self powered, was the PE-95 generator set, 10 KW,
was "part" of the entire "system" as first issued and shipped.

No. SCR-399/499, as well as the later AN/GRC-26 and most of the large Navy shipboard transmitters of the WW-II and Korean War periods were considered medium power. Roughly anything between 100 and 1000 Watts. AN/MRC-2, which used a BC-610 as an exciter, was considered high power.

Group,

I own a T368 F, BC610 E and a GPT 750

My experience is that the 610 E is it is the most relaible and easiest to use transmitter of the bunch.

I operate the 610 on 80 meters only and have ground my crystals for the three frequencies I use.

That transmitter is as relaible as a table lamp - and the 250th resembles one in operation.

I just make sure my bias on the modulators is @ 40 MA. That old rheostat like to wander.

Have not replaced any tubes in  a couple of years and they were used to begin with. Have enough to last probably last two life times

RX I use with it is a NC200.

hello , i agree, the BC610 is one of the simplest transmitters to operate as long as you do it correctly. it is extremely forgiving. i ground the xtals to the frequencies i wanted . the vfo is not all that bad, and i operated on our cw frequency and although there was chirp reported, it was not considered objectionable. it does go better with an xtal though ! the break in makes for easy operating as well. truly "the voice of victory" alan

Hi,

I am looking at diving into RTTY with a Model 15 TTY machine. Don't have it yet. If I want to TX on an HT-4 (BC-610) exactly what hardware will I need (military ok) to operate it? I know I need a converter of some kind, but how do you excite the TX in PSK? Guessing a TU unit modified or what? Cables of course.

Photos would help if you have any.

Can email me at my callsign+arrl.net or post on the board here.

Many TNX.

Greg,

To transmit with an HT-4, you will need an outboard FSK exciter. I suppose that one could modify HT-4 or BC-610 tuning units to do it but the frequency stability of them is not great and the tuning rate would make them quite "touchy". The FSK system that was built for the first model of the AN/GRC-26 was AN/TRA-7. The FSK exciter is O-39(*)/TRA-7. I've had a couple of them but not in many years. They are very roughly about the size of an R-390 and probably weigh a bit more. You can also take an outboard VFO and modify it for FSK. There was a simple circuit to do this that was once popular. Used a diode like a 1N914, a resistor, and a small trimmer capacitor. As best I can recall, that was all. Could be keyed from a Neutral loop.

I have a BC-221 mounted behind a 19" rack panel (it was acquired sans cabinet and calibration book) that has been so modified. It worked pretty well. Can't say quite as much for the buffer unit I built to go with it. The power supply was OK I guess but although I did it, I can't say I'm proud of it. Probably built around 1966, and I've learned quite a bit since then. :-) If anyone on the list wants the unit, it would be free for shipping.

The receiving converter was the CV-31/TRA-7, and was dual diversity (handles the output of two receivers). I have one that's available but it is easily twice the size of the O-39 and would probably only be of interest to someone trying to restore an AN/GRC-26. If you want to go tube type, there were several other military units built. AN/URA-6 is an IF type. AN/URA-8 is audio type. AN/URA-8A or B (no parts in common with AN/URA-8) is also audio. I have the components to assembly a complete AN/URA-6 (or maybe two) but only have one of the CV-60 audio converters. There were three or four others built in the 50's and early 60's. All pretty heavy (but then so is the HT-4). For solid state, aside from AN/URA-17, someone else will have to make suggestions. I have a Boehme Model 5C (built for ASA) that's available. Dual diversity audio with tunable Mark filter.

You will need a 170 volt loop for the model 15. I used to run one from a omebrew interface and a little radio shack color computer in 1983. The TTY doubled as a printer for the computer!

From: James M. Walker
Topic: 4368  Message: 4374

I got no response, so here goes,,,,
I operate my BC-610 transmitter on RTTY, I use a BC-610(E) same as your HT-4 pretty much, for the FSK input I have the O-39 FSK exciter (Heavy) the output of
which goes to the proper tuning unit for the band in operation, 80-20 meters, the O-39
plugs into the XTAL socket on the proper tuning unit. I put my Model 15 TTY into the
O-39 and in the STANDBY position of the transmitter, I zero the MARK frequency of
the folks I am talking with. Then it is just a matter of doing the TR thing, I usea Johnson
TR-Switch with my BC-610{s}so when I go into xmit mode the antenna is switched by the
rf coming from the BC-610. My receiver for RTTY is the R-390A and a CV-116 converter
along with a switch to toggle between the teletype machines. Hope that helps
and Merry Christmas!

Jim & Greg -

Thanks for the good info, I'm working on doing the same thing with my BC-610-H. I'll be using a Northern Radio Co. 105 FSK keyer, and have also planned on using the XTAL socket on the plugin. I've got lots of options for receive, many TUs, and will probably try all of them. As for machines, have 14-15-19-26-28 and Kleinschmidts, and I intend to try them all.

If you find one, another alternative to the O-39 is a FSK keyer made by TMC (can't remember model number), same 50's vintage as the NRC units. NRC units show up occasionally on Ebay.

Pictures of my BC-610 and RTTY gear on my personal website http://www.longandflatsociety.com in the boatanchors section.

Merry Christmas!

Subject: Re: [T-368_BC-610] RTTY with an HT-4 or BC-610, What Will I Need/Need to Do?

I got no response, so here goes,,,,
I operate my BC-610 transmitter on RTTY, I use a BC-610(E) same as your HT-4
pretty much, for the FSK input I have the O-39 FSK exciter (Heavy) the output of
which goes to the proper tuning unit for the band in operation, 80-20 meters, the O-39
plugs into the XTAL socket on the proper tuning unit. I put my Model 15 TTY
into the
O-39 and in the STANDBY position of the transmitter, I zero the MARK frequency of
the folks I am talking with. Then it is just a matter of doing the TR thing,
I usea Johnson
TR-Switch with my BC-610{s}so when I go into xmit mode the antenna is switched by the

rf coming from the BC-610. My receiver for RTTY is the R-390A and a CV-116 converter
along with a switch to toggle between the teletype machines. Hope that helps
and Merry Christmas!

Hello all,

The message I take away from this thread is that we must all make an effort to have multiple large transmitters and use them as often as possible.

Get on the air this weekend for Heavy Metal.

73

Hello again,
Folks are comapring apples and oranges. Neither transmitter was designed for
Broadcast quality, but for COMMUNICATIONS QUALITY which is MORE important in battlefield usage. If you want "Broadcast Quality" buy a BROADCAST Transmitter!

As for the BAND CHANGE ISSUE, The efficency of the BC-610 is proved out by
the POWER OUTPUT of the unit, a coil set optimized for a segment will always
be more
efficient than a Multi-band switch-able section, Tuning across several bands
takes a little longer
but the efficiency is there as the power levels can be optimized for the

segment of the bands you are using!
ENUFF SAID!

From: Bry Carling
Topic: 4378  Message: 4378

FOR SALE:

Group 10 of Rotary Switches. This is a mix of medium power ceramic types, phenolic types etc. Everything from 3 - 12 positions. Most are new, and the rest are very clean. One or two have extra sets of contacts.

Will sell the group for $22.00 plus shipping.

Please reply off the list. 73 & thanks for reading - Bry, AF4K

Hello BC-610 group. A dumb question ..

My name is Roy, K7JAQ, and I volunteer with a small museum located at the Cut Bank Airport, Cut Bank, MT. The airport was home to a WWII training base for B-17 crews.

I'm in the process of restoring a BC-610-E, s/n 260 to be used at the club Ham Radio station (W7DPK) located at the museum. A previous "owner" partially disassembled the PA deck by removing all the wires from terminal strips TS-1 and TS-2 rather than unplugging the harness from SO-1 and SO-2. Why this was done, I have no idea.

Anyway, I have successfully reinstalled the wires on the terminal strips thanks to a October 1952 technical manual. However, I have one pair of wires that look like they are positioned to connect to one of the terminal strips, but I don't have any indication in my book where they should connect. They come from SW-3 which is the plate power switch, and they enter the harness close to where the pair of wires break out of the same harness to connect to the PA plate power meter. The rest of the harness terminates at SW-7, the cw/phone switch.

We are hopefully going to get the transmitter on the air in time for the next Veteran's Day and use it as a special events station. We have the BC-939A and two speech amplifiers that also need attention, but are in pretty good condition. There was very little damage to the 610 from rodents, etc., and I have replaced several of the electrolytics, done routine cleaning, worked on all of the relay contacts, cleaned the pots, and have done a close visual inspection on the entire chassis.

I hope someone can help me determine where these two "loose ends" connect. I can provide a photo if that would help clarify my question.

Thanks for your help in advance to help solve this dumb question!

Topic: 4379  Message: 4380

Hello Roy and Happy New Year.

According to my BC 610E the two wires that are in their own laced bundle coming from the bundle where wires exit to the meter attach to terminals 1 and 3 of TS1. The colors of the two wires have changed over the last 65 years, but the colors and terminals are are as follow as best I can GUESS their color. The black appearing wire goes to terminal 1 of TS1 and the reddish looking wire goes to terminal 3 of TS1. Do your two wires appear to be that color? The two wires I am referring are laced together and are the only "two" wires laced together.

I went through the horror of having all of the wires off the terminal strips when I did the same thing that was done to the BC 610 E that you have.

I hope this helps you Roy. Let me know how you make out.

Hope winter in frozen Montana isn't too bad. It was 24 degrees F. here this morning and is supposed to be the same in the morning. I have the fire place loaded up and will stoke it again at bedtime to get us through the night. 73, John King, K5PGW

From: Harold Hairston
Topic: 4381  Message: 4381

I had to disconnect the chassis AC wiring from J-14 to replace the caster wheel. I did not make a record of the wiring as I would go to the Schematic for rewiring. Well, my schematic is not clear on this wiring. There is a Green-Brown-White wire and a Green-Red-white wire coming from the harness. The Green-brown-White seems to be a bit larger than the Gn-Rd-Wh wire.The Gn-Rd-Wh wire is tagged with the number 16. J-14 is a Twist-Lock type Male receptacle. One blade is copper colored and the other two are brass looking. One of these is grounded to the chassis.Can some one advise me the correct wiring from the chassis to J-14? If I knew which terminal should receive the Hot ac wire, I think that I would be ok. Thanks, Harold

Hi Ed Perry Here if you would take a ohm meter and check from chassis to either one of the leads ou have reference to you will
find that one will go to ground and the other to the cathode of the osc tube the 6v6 you will also find that if the two wires are not under the right terminals that you can not key the transmitters  osc. with the exciter switch in up position....

Perry w5kgz

Have you checked McMaster-Carr or Fastenal? Between the two they generally seem to have just
about every imaginable bit of hardware.

John;

Thanks for the info on DZUS suppliers. There is some hope there.Yours was the only response (Over-time, I have been very disappointed with the lack of responses from the T-368/BC-610 List).

Trevor,

In the McMaster catalog (on their web site) you won't find Dzus fasteners
by searching for Dzus. McMaster almost never shows the actual manufacturer's
name in their catalog. You have to search by generic description.
However, I just did that (quarter-turn fastener) and all I found was something
similar to the less common Dzus design (the one with the pin through the nose of
the screw). However, the one I found would not be intermatable with the
Dzus as it doesn't actually use a pin.

Hi Harold -

The Dzus fasteners were used extensively on vintage aircraft. Ordering them them from Aircraft Spruce is the easy part... you will need special tools to install them. I got lucky, one of the guys at my airport had an entire set. You'll probably be able to track down what you need if you ask a vintage aircraft mechanic - that is, an old dude that fixes flyin' machines.

Bob;

I had found Aircraft Spruce. They may have the correct fastener or something that will work. I have sent them an inquiry. FYI, I am replacing the rear cover on the T-368 with a PlexiGlass one. I hope to use the existing female fastener on the chassis with a new male with longer male post. The PlexiGlas is 3/16' thick.

Harold,

I have not owned a T-368, but do own a couple of BC-610s.

I absolutely would not replace the rear panel of a BC-610 with Acrylic.
That would turn an RF Field loose in the shack/den. The rear panel IS
the shield for the rear of the radio.

Perhaps the T-368 may have other shielding in place, I do not know.

No problem. I've been running my T-368 completely open on the back for years in several different shacks and shack arrangements. No difficulties encountered, RF, cooling or otherwise.

As I stated in the beginning of the message, I do not own, nor have owned a T-368.

The BC-610s/T-213s have NO shielding of the 250TH, nor ANY of the PA coil and tuning components,, *EXCEPT* for the rear panel. I DO know that this will dump RF into the shack if I were to run without.

Just a "possible" issue. Mac, if it doesn't bother anything with a T-368, have a ball!

# 4400. FS: PAIR OF 811A Tubes for $6.00

Yahoo group: T-368_BC-610
Date: 2011-01-22 19:44:36 UTC
From: Bry Carling
Topic: 4400  Message: 4400

For sale:

Two 811A Tubes for $6.00 total.

These are good looking used tubes, but don't look overheated
or anything. Great for tube homebrew. One is a nice RCA tube and
the other is a Sylvania, but they look the same inside. No boxes
but will pack them carefully for safe shipment.

"Why are these so inexpensive?" you may ask!

Well, the Sylvania one is missing the plate cap, and I don't have it.
Just the wire on top so you will need to connect to that, which is easy
enough.

I figured the RCA one is easily worth the $6 and the other is a freebie.

So - let me know ASAP if you'd like tyhese and they are all yours!

Topic: 4401  Message: 4401

I am having a problem with getting my 614 up and going, this was in really poor condition so I replaced almost everything, shotgun method. My issue is no audio output, so in testing I have verified power supply is OK, Sidetone circuit works great. Checked resistances against the chart in the manual, verified my wiring twice against the schematic and still no go. If I inject my signal generator (~400Hz) at pin 3 of V102 I get output. I should mention I have the 500ohm load resistor at the socket and a speaker (8ohm) across the load resistor, also a scope but the speaker gives me instant info.
Moving back a stage if I clip to gain control side of C102 I also get output, but not as loud (I know that's subjective). clip to pin 6 of V101 I get nothing, other side of cap ok, so I replaced C102 with another one, orange drop .01/600V, still nothing.
If I inject the signal into the grid at pin 2 still nothing, which I would think is expected if injecting at 6 does not result in a signal.
So trace out my wiring again, I lifted the carbon mike pot at the c119 side to eleminate the cabon mike portion.
It seems to me like V101 may be bad, so try another one (I got several NOS) no help, and the hickock says all 3 I tried are good.

V101 checks
Fil at 7/8 and fil lights up
.6 volts at pin 3 - verified R106 is 4.7K
pins 1,4 and 5 are tied to ground (verified that ground is ground)
pin 6 has 66 volts (book says 50v, credit to higher line voltage)

Any ideas? Anyone? I am at a loss as to what to do next, this should be a simple exercise really, and for some reason I can't figure out what the issue is.

Dave, N8ZFM

Dave,

That is weird. Before I do any guessing, the 500 ohm resistor you say you have across pins 6 and 7 of the output octal connector is redundant. It's totally swamped by the 8 ohm speaker. This couldn't very well have anything to do with the dead front end but you should have a line to voice coil transformer connected there instead. If you have an LS-166 or LS-454 those would work fine.

Do you have an O'scope? If so I'd connect it to the lead from your signal generator (which I assume has a capacitor in it to keep DC out of the generator) and see what you get. Then connect the lead to V101 pin 6 and see what happens to the signal. I know that resistors don't normally fail shorted but check R107. Should be 100K. The fact that you said you seem to get weaker output with the signal generator connected to the grid side of C102 than you do with it connected to the plate of V102 could indicate that the plate of V101 is bypassed to ground for audio. That would be the case if R107 were zero to a few hundred ohms as C113 (8 ufd) would be across it to ground. That would also jive with the V101 plate voltage being a bit high.

Topic: 4401  Message: 4403

Robert, thanks and I agree about the load resistor but I had it tacked into the octal connector as part of the "test and alignment" part of the manual and it gave me the leads to alligator clip the speaker, I just wanted to hear if there was a distorted signal since my scope was telling me there was not when I found injecting at C112 produced output (scope was right). So I still had it clipped on when I started back along the audio chain, working from output back. Originally I had the scope on the 500Ohm resistor when I 1st powered up and got excited that there was no smoke.

After reading what you say about R107 I went and checked real fast, 100.6K - C113 is a bit larger at 32uF as that size can (dual) fit the hole in the chassis, in fact C113/112/108 and 109 are all 32uF but that should not cause an issue I don't think. - Or at least that was my reasoning since it looked to me to be DC filtering.

Do you think that could be an issue?

When I check it seems to me that gain on V102 is also very low but figured I had best figure out the V101 issue first. Thinking, and waiting for your feedback, if it was the capacity of C112, since 113 is also 32uF that would have the same effect on V102. Still very much learning, I am a pro at network engineering in the computer field, ham radio is a hobby and analog is self taught, with the resultant gaps in knowledge.

Yes, I am feeding the signal thru a small mica cap to keep DC out of the generator.

With the signal fed in thru the dynamic mic connector, I see the signal on Pin 2 - nothing at all but DC on pin 6 - signal fed into pin 6 disappears on other side of c102 so having the plate of V101 bypassed for audio certainly seems to me to be the issue, but it's not complicated, from C113 to pin6 is just a single resistor and it's the correct value.

Something going up in smoke due to a silly wiring mistake would be much easier.....

I got the 610 putting out good clean 250W CW but I am better at circuit diagnostics than I am with CW so need to get the audio going to put it on the air, I also need to find out how stable the VFO is or else track down a 3895 rock.

Dave,

OK on the 500 (or 470) ohm resistor. It isn't hurting anything but it would be better if you had a matching transformer to the speaker. However, that couldn't be causing the problems around V101.

No, having the electroylitics as 32 ufd instead of 8 doesn't have anything to do with the problem.If anything, when you finally get the thing working it could be slightly quieter.

As R107 is OK and you do get some signal out when you drive V102 grid the problem would appear to center around pin 6 of V101. Disconnect everything from the BC-614 and pull V101. Hook the scope probe to the loose end of the blocking capacitor attached to the cable from the sig gen. Note the peak to peak amplitude (set the amplitude to some convenient amount). Touch the capacitor lead to V101 pin 6 and note the reading. You can calculate approximately what the drop should be from the schematic. If it doesn't drop more than it should, reinstall V101 and turn the BC-614 on. Make the test again (with no other changes).

Robert,

Got back to it this evening as soon as I got back home,
removed tube and same, so got the idea to disconnect the wire (rg174)
from R108 to the wiper of the gain control, wow tons of gain out of
V101, so I pulled out my 4 pieces of RG174 (just pulled all 4 as I had
them cabled together all nice and neat) and am going to replace them, my
signal was being swamped either in the wire, or at R111, I am guessing
the wire as now that its back being disconnected except to ground, R111
looks fine on the ohmmeter.

Let you know how it goes, I think I may have finally got to the answer
with your help!

Dave,

OK on the 500 (or 470) ohm resistor. It isn't hurting anything but it
would be better if you had a matching transformer to the speaker.
However, that
couldn't be causing the problems around V101.

No, having the electroylitics as 32 ufd instead of 8 doesn't have
anything
to do with the problem.If anything, when you finally get the thing
working
it could be slightly quieter.

As R107 is OK and you do get some signal out when you drive V102 grid
the
problem would appear to center around pin 6 of V101. Disconnect
everything
from the BC-614 and pull V101. Hook the scope probe to the loose end of
the
blocking capacitor attached to the cable from the sig gen. Note the peak
to
peak amplitude (set the amplitude to some convenient amount). Touch the
capacitor lead to V101 pin 6 and note the reading. You can calculate
approximately what the drop should be from the schematic. If it doesn't
drop more

than it should, reinstall V101 and turn the BC-614 on. Make the test
again
(with no other changes).

Dave,

The way I looked at it was to assume your comment about lower output being achieved on the grid side of V102 than on the plate was correct. That seemed to point to the left end of C102 (you connected the sig gen to the right side) going to ground for AC but not for DC.

However, your comment about RG-174 is confusing. There isn't any of it in a BC-614. And as it has a relatively high capacitance per foot, it would not be good to use in a high impedance audio circuit.

Topic: 4401  Message: 4407

Had not thought about that aspect of RG-174, called for shielded cable and it was thin and on hand. I just finished replacing with some mystery coax I have had for a couple years, looks to me to be for UFH or SHF as its teflon foam and silver braid, about the same size but unmarked, forgot I had that roll.

Just finished the replacement and I am getting a good signal out now. Too late here now to go on with the testing part of the manual, just shoot a signal in at the mic jack look at the output on the scope, was about 4V p-P on the output but I also looked like I had some hum on the signal, that fits with what I have heard but having some hum might be harder to eliminate but beats the heck out of no signal.

The coax I removed I did not find a short so it may have been capacitance, probably never be sure.

So learning - shielded wire is not all equal, and wire that I can run RF through is not necessarily good for audio.

The only original parts are the jacks and pots, and the iron. I replaced every part with a new component, and all new 16g teflon wire, I did the cabling just like the original but using nylon zip ties, no longer a collector item for sure, but one that I should be able to use on the air for a good while without worrying about repair other than a bad tube. (or so in theory).

I really appreciate your advice, was really frustrated and about to give up for a while.

Can I make a sched with you somewhere on 40 or 80 here when I get it all pieced together and a cobbled up jb70 (I don't have a jb70), am in Louisville, used to be in 8 lamd about 20-30 mi north and 80mi east, used to have really good 80 m skip to 5 land pretty much any evening. I am figuring a couple weeks at most to get er done.

Well, now that it's working and with almost all new components inside, It should work a long time.

The only antenna I currently still have up (a random length wire that has been up since the 70's and survived all hurricanes since Alicia) does very poorly in your direction at your range. I have several military antennas I've bought over the years but have never had time to put up.

Coaxial cable is generally not a good choice for high impedance audio circuits.

Fwd from another list:

I remember reading an email or article a few years ago (maybe 2-4) concerning a simple cure for the typical hum in a BC-614. I searched the ER index to no avail. Does anyone remember this piece and where it might be?

# 4412. REDUCED: USA Made Power Resistors

Yahoo group: T-368_BC-610
Date: 2011-01-26 12:55:53 UTC
From: Bry Carling
Topic: 4412  Message: 4412

FOR SALE: USA made Power Resistors

Suitable for bleeder resistors in HV power supplies, etc.
These are good quality, new old stock parts. QTY 1 each.

Now reduced - $6.00 to $18.00 each.

Picture and ordering page at:
http://www.af4k.com/resistors.htm

50,000 ohms at 100 watts
25,000 ohms w/slider at 100 watts
25,000 ohms at 100 watts
25,000 ohms at 75 watts
25,000 ohms at 50 watts
24,000 ohms at 72 watts
20,000 ohms at 100 watts
20,000 ohms at 50 watts
18,000 ohms at 86 watts
18,000 ohms at 55 watts
16,000 ohms at 50 watts
15,000 ohms at 120 watts
15,000 ohms at 72 watts
14,000 ohms at 50 watts (QTY 2)
12,000 ohms at 116 watts
12,000 ohms at 75 watts
12,000 ohms at 68 watts
12,000 ohms at 40 watts
12,000 ohms at 30 watts

Hi Ed -

That would be me, probably, I told you about it at MRCG a couple of years ago. I had to take the chassis and quite a few transformers down to bare metal during the restoration of my transmitter.

I had all the chassis replated at a shop in Burbank, then I made silkscreens for many of the power transformers and large capacitors and vinyl stencils for all of the lettering on all 3 chassis. Some good pictures before and after on my website http://www.longandflatsociety.com in the boatanchors section.

I still have the screens and I'd be happy to cut another set of vinyl you can use for stencils. I also have the Corel artwork files if you just need that. Let me know.

# 4414. FS: Terminal Strips & homebrew parts

Yahoo group: T-368_BC-610
Date: 2011-01-27 12:45:35 UTC
From: Bry Carling
Topic: 4414  Message: 4414

FOR SALE:

Group of 20 good quality terminal boards - great for homebrew tube type amateur radio or audio construction projects. Hard to find, top quality phenolic, fibreglass and bakelite boards. For $12.00 plus shipping. (photo link below)

Group of Four variable capacitors - ceramic frame, USA made old stock caps, 100 pF, 80 pF, 30 pF etc. Total of 4 pieces for $20.00 plus shipping.

Bleeder resistors $6 - $18 each

Power Supply, 14.0 Volts DC at 4.5 Amps - $5.00

Heathkit HD-15 Phone Patch, like new - $15.00

Junk box of parts - may include caps, power supplies, tubes, resistors, plugs, adapters, crystals, variable capacitors, fuses, hardware etc. - two available for $15.00 plus shipping.

RF Chokes, 2 mH pi-wound types with axial leads - rated 50 mA Available for $2.00 each

RF Chokes, 1 mH pi-wound types with axial leads - rated 50 mA Available for $1.00 each

GROUP OF SIX panel mount fuse holders - traditional cartridge fuse sizes. Very standard for homebrewing and repairs. All for $6.00 plus shipping.

Pictures and details with ordering page, here:

Hi All,

I have a T-368F in very nice condition for sale in So. Cal. I'd rather keep it but there's just no way to get it into the 2nd floor condo. It's currently residing in a 14-foot box truck with a lift gate, which is also for sale, and delivery is negotiable. You can come and see it in Torrance, if you'd like. Priced to move at $1000 for the transmitter, $3000 for the truck.

Dave,

I searched the online Electric Radio index and can't find the article I told you about. The only other places I can think I might have read it are in QST or on the boatanchors reflector. The archives of that reflector are available but are a bitch to search as you have to download each month's worth in a compressed file, then expand it and use your computer to search. I have no idea what month/year this article was in but I will try to find out.

The hum fix was extremely simple. If we're lucky, I might have printed the email and stuffed it in my BC-610 file. I will check that today.

Later,

Subject: RE: [T-368_BC-610] BC-614E stumped

Had not thought about that aspect of RG-174, called for shielded cable
and it was thin and on hand. I just finished replacing with some mystery
coax I have had for a couple years, looks to me to be for UFH or SHF as
its teflon foam and silver braid, about the same size but unmarked,
forgot I had that roll.

Just finished the replacement and I am getting a good signal out now. Too late here now to go on with the testing part of the manual, just shoot a signal in at the mic jack look at the output on the scope, was about 4V p-P on the output but I also looked like I had some hum on the signal, that fits with what I have heard but having some hum might be harder to eliminate but beats the heck out of no signal.

The coax I removed I did not find a short so it may have been capacitance, probably never be sure.

So learning - shielded wire is not all equal, and wire that I can run RF through is not necessarily good for audio.

The only original parts are the jacks and pots, and the iron. I replaced every part with a new component, and all new 16g teflon wire, I did the cabling just like the original but using nylon zip ties, no longer a collector item for sure, but one that I should be able to use on the air for a good while without worrying about repair other than a bad tube. (or so in theory).

I really appreciate your advice, was really frustrated and about to give up for a while.

Can I make a sched with you somewhere on 40 or 80 here when I get it all pieced together and a cobbled up jb70 (I don't have a jb70), am in Louisville, used to be in 8 lamd about 20-30 mi north and 80mi east, used to have really good 80 m skip to 5 land pretty much any evening. I am figuring a couple weeks at most to get er done.

Subject: Re: [T-368_BC-610] BC-614E stumped

Dave,

The way I looked at it was to assume your comment about lower output being
achieved on the grid side of V102 than on the plate was correct. That seemed to point to the left end of C102 (you connected the sig gen to the right
side) going to ground for AC but not for DC.

However, your comment about RG-174 is confusing. There isn't any of it in
a BC-614. And as it has a relatively high capacitance per foot, it would

not be good to use in a high impedance audio circuit.

Dave,

Coming in late on this thread, but are you talking about a low level
of hum on the carrier that persists no matter what corrective measures
you take in the audio circuits?

Dennis, well I got past my initial problem, it was apparently a bad wire to the gain controls, I had used Rg174 for the wire. I replaced that and its fully functional now. So the hum, after getting it going I had the output on my scope and I clearly see some 60 cycle hum on the sine wave, as I don't have my cable finished yet to the 610 I can't say how bad it sounds. I expect there will be some hum but hum is far better than when I had no output at all.

Planning on getting the cable finished up over the weekend and then I can listen on a RX and see how she sounds.

OK, just wanted to pass along that hum on the RF carrier is not a new BC-610 problem. Some 610's exhibit this trait and some don't. The late Bill Feldmann, N6PY. cured this in his BC-610 by bypassing the cathode of V9 (6L6 buffer doubler) in the RF driver chain for audio as well as RF. Hung a 40-50 mfd electrolytic across the cathode resistor R24 in parallel with the original mica bypass cap C8. Believe he did cover this in an ER article along with a lot of other BC-610 information but I don't have the issue date/number..

Hope this helps.

Dave,

The Feldnmann article is in ER#186, Nov. 2004. Bill actually added a 470 mfd bypass cap (mislabeled 470 pf in the schematic on page 3) along with a .01 unit. Bill and I were good friends and we puzzled over the hum problem at some length at the time. I don't buy his explanation of the root cause of the problem as presented in the article but the added caps did seem to effect a cure. Bill went on with a lot more discussion of the BC-610 in ER #186 and in *previous articles in ER's #178 and #185 which you might find interesting..

V9, the 6L6, should always be a metal tube. Glass ones will cause
nothing but grief.

V9 is PURELY in the RF Driver section, NOT in the audio chain whatsoever.

Yes, Bob, I know that. Read my following post (1/28/11) and the ER articles referenced therein and hopefully it will all become clear to you.

From: mac
Topic: 4424  Message: 4424

All,

i have a DVD available covering a lecture by Rick Ferranti given at a 1999 IEEE seminar at MIT titled "Radar before the Magnetron." Material covered includes the WW2 British Chain Home and US SCR-270 radars. Running time is 1 hour, video quality is VHS.

Copies $5.00 each including shipping which just about covers my costs. PayPal, check, MO, cash all gratefully accepted.

Dennis D. W7QHO

Alan,

I don't have an extra one of the keys (only one I have is in the chest with my TBX-8) but the plug is the Navy version of the Signal Corps PL-55. May be marked NAF 1136-1, NT-49109, or even PL-55.

The "correct" headset is NT-49507, -A or -B. The -B model (which was probably current when TBX-8 came out) was later renomenclatured as H-116/U. This a 600 ohm headset and is also equivalent to H-113/U except that the 49504 has a male Duradot snap fitting on each receiver for attaching the Navy version of the T-45 lip microphone. It has an 18" bail-out cord terminated in the Navy equivalent of PL-54 (number doesn't come up). Requires CD-307-A or Navy equivalent NT-49534 extension cord In all of these, the receivers are attached to the headband with a single screw, not with the C-clip with pins as common on most other headsets of the period. The 49507 has a leather covered headband. The rest of it is black. The -A and -B models have a black plastic sleeve over the headband. The two AN nomenclatured sets are as the -A and -B except green.

# 4430. TBY sets

Yahoo group: T-368_BC-610
Date: 2011-02-01 08:59:00 UTC
From: Roger Basford
Topic: 4417  Message: 4430

Hello Alan,

I didn't know he was making PSUs for the TBY series, what is he asking? Have three TBY-8s here, one with the accessories, vibratory PSU and original battery, but haven't made any attempt to put them on-air as yet. The battery is well-dead, but I was thinking of making up a 4 volt cell from gel batteries, if I can find some 2 volt types.

Cheers

Roger

Thanks Alan,

That sounds like a fair price, do you have his contact details?

Yes, I saw your TBY on ebay, hope you get a buyer, I've posted a link to it on code-talkers. They are an intriguing radio, they seem to have been quite common over here too, I had one in the 1960s when we didn't have 50MHz. I did try using it on Four metres but I didn't have any luck, probably due to poor frequency stability, everyone else was using crystal-controlled AM Pye Vanguards and Cambridges! Alas, my sheet-metal working isn't really up to the job of making a box but I live in hope that the rest of the accs will turn up one day.

See you on the code-talkers group, maybe?

From: Roger Basford
Topic: 4417  Message: 4434

Thanks Alan,

The discussion about the TBY has prompted me to order a couple of 2 V gel cells to test the TBYs I have. I found a firm in Cornwall that sells batteries for things like model boats and ordered from them. See you've joined the code-talkers group so will see you on there as this is a little OT for the BC-610 group :-))

Oops! I really blew that. You wrote "TBY-8" and I read "TBX-8". Sorry.
I had just been wishing that I had time and space to bring my TBX home and
try to get it working. That's my excuse, anyhow. So nothing that I wrote
applies to the TBY. Except my comment about never getting it on the air. :-)

I But now I understand why you were asking about the plugs. I have
somewhere a few both 3- and 4-pin but I think the problem was they have a different
key location. I'll try to find them and see. I had two of the complete
headset-microphone assemblies but sold them last year. All I have left that I
know of is the "W" cord and a pair of receivers. No head strap assembly.

Roger,

I have one of Pietro's TBY converters. The guy I sold my last TBY-8 to already had one. Looks like I paid $95 for it but that may have included shipping as I got it from someone over here who bought several at once. However, I don't need it and if you do, I'll match Pietro's price including shipping.

FWIW, Pietro also makes one for the MAB/DAV.

hello bob, well, that will soon be remedied i hope ! the only identification i can find is on the rubber earpad. it is CMO-49104 . if you look on ebay, i have put it on with a ridiculous starting price as i do not care if i sell it or not.you can see the headset i was hoping to sell the complete one and keep the other. i have sent for a purpose built inverter for it. alan

Hello Robert,

AFAIK, the vibrator PSU I have works OK but until the two cells I've ordered turn up I can't test it, as I don't have a variable PSU of enough current rating to power the vib unit. If the vib is U/S then I may take you up on your offer.

I'm in the market for either a TBY key or the plug to fit the radio.

I'll be in touch about the inverter.

Good Evening All,

My T-368-E has oil seeping from its T9 HV Plate Transformer. The old girl works FB based upon a signal reports during Saturday morning's OMR Net. However, I assume my days are numbered.
I saw an old post on AMFone.net in regards to repairing oil filled transformers with JB Weld, sparingly used.
Unless someone has an extra T9 for an E, that is my strategy, also, and I would appreciate comments pro, con, or otherwise on this strategy.
I am not yet sure from where exactly the seepage is coming, and that may be a factor.
Also, if anyone has repaired an oil filled transformer, what is the best way to refill the lost oil? Punch a fill hole in the top and reseal it afterward?

Hi, Mike;

I have two T-368's but don't have a long history of knowledge or experience with them. No doubt, there are folks who do. I didn't think that the HV Plate Transformer contained oil. I do know that the Filter Caps contain oil and tend to seep over the years. I will be very interested in your solution. Please keep us informed. And good luck.

I agree with Harold,
on this one. Don't remember oil in the T-368 HV transformer. It is
sealed all the way around with what looks like a weld. I have NEVER
seen oil in the transformer though. I may have a spare I would need to
check though.

Hi Mike

"Seeping" as in leaving a stain on the garage floor?

Or seeping as in there is an ever so slight amount of discoloration on the chassis?

Mine leaves an ever so slight amount of discoloration on the chassis. It hasn't been worth chasing.

You will get more opinions on a fix but...

The success of any repair will require cleaning and thorough degreasing/deoiling. And then you will need to clean it and clean it again. You might consider a flexible sealant like 3M 5200 urethane sealer instead of a rigid sealant like JBWeld. 5200 may seal better when the joints of T9 are flexing with temp changes. Wear rubber gloves and let it set up for at least 24 hours. It is thin and flows during cure.

How much oil have you lost? If you plan to operate continuous duty RTTY in the tropics it is probably worth thinking about a refill. But the OMRN duty cycle is fairly low. Hopefully we can all get by without adding "topping off transformer oil" to the maintenance list. The thought of having a drill bit grab and runining the transformer would keep you up at night.

Good Morning All,
Thanks for the responses all around.
Yes, Jim and Harold, I had initially suspected a leaky cap as I had one fail already and replaced it couple of years ago, and I was surprised to see the oil film apparently coming from T9. Could have sworn I read in the manual it was oil filled, but I'm not seeing that now. Jim, I will probably try repairs first, but if you do have a replacement for an E (dual primary windings) let me know.

Tom, yes, my "seeping" means there is a small amount on the shack floor which I would measure as a dozen drops (or slightly less) from the chassis over the last couple of months. The concrete pad slopes a bit so it didn't pool much inside - just made a beeline for the left front corner and then the floor.
Thanks for your advice re the 3M 5200 sealer. Makes sense to use it for the flexibility plus I am generally sold on 3M products.
QSL on the degrease, deoil, clean, repeat!
Glad to hear we may be OK and avoid a refill given my low duty cycle. I couldn't have lost much oil, and I hope I've discovered it early.

I'll continue to take comments and will report back on the project.

That's the real secret to the longevity of these military and old broadcast rigs in amateur service, Mike. They don't see the use and abuse they did in 24/7 or RTTY type service. Keeping the bugs from becoming big problems is the key. Even if you've lost a fair amount of the oil, it's not likely you'll transmit long enough to overheat things. That's a sizable chunk of iron able to dissipate quite a bit. Worst case scenario, you add some additional cooling (though it really shouldn't be necessary).

After you clean and degrease, I'd suggest wiping the area down with a cloth damp with alcohol to remove any film left from the degreaser. That should insure a good bond for whatever you end up using to seal things up.

I'm just across the map from you 45 mins or so, over in the Wilton/Franklinton area. There's a D model sitting in my radio area with a hard fault in the HV circuit somewhere. Hoping to get it back on the air soon. Good to know there's at least one other T-368 user in the vicinity.

Mike,

Long term experience here with a couple of T-368s but no leaks. Remember this coming up on the list before, though. Leaking around the terminal seals would seem to be the most likely scenario. Worse comes to worse one might consider flipping the transformer over on it's back with the terminals pointing up. Would require additional mounting hardware and lead extensions of course.

Good luck.

The dimples on the top of the transformer are solder-in-place covers for filling with oil. Most likely the oil is coming out of the HV insulators.  Do not solder on these posts as the heat will most likely make the problem worse.  You can try to clean the area around the insulator with alcohol and then use some very thin super glue around the base.

It worked for me!

FB on all. Thank you for the support; very encouraging.
Wish I had the free time (and electric utility budget - hihi) to really push the duty cycles of my T-3 and BTA-1R.
It's a slippery slope when they are off the air for repairs. Seems like other issues soon creep in once they are back up. Oh, how I do love it, though.
Thanks for the suggestion of an alcohol wipe down to assure adhesion.

Given our close proximity to each other, I'd be delighted to assist you in any way I can even moving our beasts and/or components. Just let me know. Plus, everyone is invited to visit/see/operate the newly organized AM position in the shack.

That's the real secret to the longevity of these military and old broadcast

rigs in amateur service, Mike. They don't see the use and abuse they did in

24/7 or RTTY type service. Keeping the bugs from becoming big problems is

the key. Even if you've lost a fair amount of the oil, it's not likely

you'll transmit long enough to overheat things. That's a sizable chunk of

iron able to dissipate quite a bit. Worst case scenario, you add some

additional cooling (though it really shouldn't be necessary).

After you clean and degrease, I'd suggest wiping the area down with a cloth

damp with alcohol to remove any film left from the degreaser. That should

insure a good bond for whatever you end up using to seal things up.

I'm just across the map from you 45 mins or so, over in the

Wilton/Franklinton area. There's a D model sitting in my radio area with a

hard fault in the HV circuit somewhere. Hoping to get it back on the air

soon. Good to know there's at least one other T-368 user in the vicinity.

Hi Dennis,

Thanks for the advice. Definitely considered flipping T9 over as a worst case. Sounds like terminal leakage is the culprit. Will investigate.

As soon as the T3 is 100%, I'll be working on the T-195. Have a hardy PS built by K0OUX and myself and I hope we'll be OK after replacing the 4X-150D.
But that's the next project.
I'll keep you apprised.

Joe,

Somewhere back in time...one of the techniques, although a pain, was to remount the xfrmr with the post up rather than down...not a total solution...but is a working solution....I like ur idea of the super glue technique...but it is absolutely imperative to clean/was all oil off the base of the post...must be ''de-greased' so to speak....

Read the posts regularly...not too much work just now on the T3s . . . mine are both working last I was on the air with them...but, with these big beasts getting some miles on them....they need TLC from time to time....

Am currently 're-kitting' an Eldico L100/P100 linear....very little known about it...it's not the amateur version from the '60s...uses three 4x300 and a monster ps...for abt 1.8 kw with no pushing...typical Dayton find...some genius hacked up the wiring...so have stripped the rf deck down to nuts and bolts...with repaint and total rebuild...will take some weeks yet to complete...then on to the Ps...super heavy....2.5kv at one amp...it is also due for re-kitting...

So beyond busy...not much extra time....did make the heavy metal rally a few weeks ago...used my now totally rebuild Globe King 500B . . . what a mess that was...but now the beast is happy, stable and getting great audio reports...dedicated to 160 meters...

Sure would like to do Rochester again...hvn't been in several years...mom in law passed this past summer so ... activity has been totally mixed up for some months...just getting back to routine...and maybe a less complex summer....

Hope all is well with you....

The best alcohol to use is denatured. Any of the isopropyl and/or
rubbing types have an "oil" content that leave a thin film.

Expressly for cleaning a surface without leaving a film, I keep a one
gallon can of denatured alcohol around. The only other way would be to
obtain pure "grain" alcohol, or Ethanol. That usually ends with with
being harder to obtain and ends up with the state adding extra taxes.

Group,

Curious timing that this post should come up now. It has been about 3 years almost to the day since I cured a leak on the plate transformer of my T-368-F. Oil was seeping from one of the insulator orings.

My solution was to remove the transformer.
Invert it on the work table.
Thoroughly degrease the area.
Apply a liberal ( one of the better uses for that word ) application of JB Weld to the insulator.
Seal the immediate area and outward  two inches or so.
Apply more if necessary to "build the area up."
Let cure for specified time.
Like I said, been three years and no more oil seepage - I keep a sheet of paper underneath it to indicate any problems.

I can relate only too well, Mike. Next to the 32V-2 Peanut Whistle, the T-368 is the 'small' transmitter here. The largest is a converted Collins 21E which the former owner said raised his electricity bill by roughly $150/month when he used it regularly, several nights per week.

Of course, everything here on the transmitter side is currently broken or down for one reason or another. Hopefully that will change soon, and even the T-368D will finally return to the air. It was given to me by W1DEC in 2006 as a wedding gift, and hasn't been on the air since at least 2005 due to a HV short.

Given our close proximity to each other, I'd be delighted to assist you in

Ditto, Mike. I've met many of the local group so far (Nick England, JP, Jon Brewer, Tom Bridgers, Wilson Lamb and many others) at Shelby and elsewhere. Looking forward to meeting up with you in the near future. The Raleigh 'fest is just around the corner.

Good luck with the oil leak, be sure to let us know what you find.

Hi all,

I was just given a Tek 434 scope that isn't working altogether right and I need a service manual for it if anyone has one real cheap.

I also need a few knobs, like the Channel 2 volt/div. knob and the Ch. 2 position knob.

Thanks,

Joe

Topic: 4472  Message: 4474

Greetings Niel
Did you use to live in Austin?  I might have visited you along with Paul N1AAC back in 1989.  I recall you had a big navy transmitter you just acquired.  Anyway wanted to say howdy.  I recall you also had a very neat mouse key.  I finally got a mouse key last year.

FOR SALE:  Beautiful High Power HF Antenna Tuner with Roller Inductor
and Balun. Has heavy duty components and must be at least 1500 watt
rating.
Vernier tuning dials, and a clear numberical readout for the roller inductor.
Antenna connections uinclude single wire, balanced feedline and coax.
Connection
to transmitter is via SO-239 coax connector.
Another nice feature of this tuner is the perforated, slant cabinet,
which matches Collins equipment.
Will outperform most commercially available tuners of today.

Available for $175.00 plus shipping.

Pictures and details here:

# 4479. Ernst Krenkel's BC-610-E

Yahoo group: T-368_BC-610
Date: 2011-03-15 06:44:22 UTC
From: Roger Basford
Topic: 4479  Message: 4479

Hi All,

I found a little bit of BC-610 history whilst browsing a link from the WS-19 group this morning, a photo and some details of the BC-610-E used by RAEM/Ernst Krenkel, a Hero of the former Soviet Union. See:-

http://www.rkk-museum.ru/vitr_all/v17_e.shtml

The RKK museum is worth a look too, lots of well-restored WWII Allied and especially German gear on show at:-

http://www.rkk-museum.ru/vitr_all/v16_e.shtml

There's a recent British article on Krenkel here:-

http://hamgallery.com/Tribute/RAEM/krenkel.pdf

Good to see his '610 is still in existence, although it looks a little battered and probably won't benefit from the AR-88 sitting on top!

For a brief history of the SCR-299/399 in Russia, see:-

http://www.w9wze.net/df.php?dn=Features/Hallicrafters_in_WWII/Marshall_Zhukov.wp

Subject: [EuroBA] Beware this seller!

Hello friends,
bought on ebay item number 130487345390 ( Clansman PRC 320 military radio complete pack kit) the past february 21 from this seller tactical-x-hire
with excellent feedback story, and paid 475 GBP via Paypal, shipping included.
Problem is the seller disappeared, did not respond to personal emails or ebay messages, did not refund payment, never heard since.
While waiting for a solution by ebay, I feel obliged to warn all members of this and other related groups: this guy is still has auctions in progress everywhere.
Will keep the group informed.
All the best!
Francesco Sartorello

Topic: 4486  Message: 4487

Alan,

My first reaction was to cross-post this to Yahoo PRC-320 but I did a few ebay checks first. I would beware of cross-posting this message on a UK group in case you land yourself in the soup with libel law! The seller still seems to be on ebay and is selling more PRC-320s, with 100% feedback. This alert could be perfectly genuine, a hoax or possibly an attempt to blacken the seller's reputation. I don't know who "tactical-x-hire" is and I've never traded with him. I stick to a local Norfolk dealer for Clansman kit and collect in person.

Just my 2 pence-worth,

Roger/G3VKM

From: Bry Carling
Topic: 4488  Message: 4488

Reduced - RF Tank Coils for sale.

Group of 4 useful RF power amplifier tank coils, suitable for QRO applications etc.

GROUP OF 4 TANK COILS

Here are four surplus RF tank coils. Two are plug-in,
jackbar types with center tap and coupling coil. One has
the banana plugs missing but these are easy to replace
with standard banana plug parts. The other two comprise
a ceramic coil, and a phenolic core coil.

Available for $9.00 each or will sell all four for
$30.00 plus shipping.

The first thing to consider:

Make your password a STRONG one!

1) Eight or more characters, Use upper and lowercase, and include
at Least one "special character".

(Those are the ones that are uppercase above the numbers.)

Next:

Avoid using Web access to store your address book.

Those that would hijack an account reap ALL addresses stored on-line!

Please use a "local" E-mail Client if possible!

I've been using Thunderbird for years. There definitely are others!

I personally avoid Outlook like the plague. NO - I am NOT anti-MS!
There has just been too many ways to get into it!

Perry, I didn't know you had a T-368. I've got a pair of 4-125's and a 304TL. Might be an interesting mod ;-)

I've also got a pair of 100TH's, if anyone is interested...

73 = Best Regards,
-Geoff/W5OMR

# 4512. Moving a T-368

Yahoo group: T-368_BC-610
Date: 2011-05-19 01:08:39 UTC
From: niel_w0vlz
Topic: 4512  Message: 4512

Next week I'm helping my local museum get their T-368 ready and loaded on a truck bound for the AWA Museum in NY.

I'm certain I've recently seen a photo essay showing T-368 loading, securing, unloading. Can anyone point me towards some photos I can refer to? Two images I recall from the ones I saw...one of the transmitter strapped inside a U-Haul truck and the other of the PS/Modulator deck being slid off the truck on a wooden ramp.

My thought is that this thing was designed to be in the back of a truck...the main thing is to make certain it won't move around and that the decks stay in place. How about the tubes? My thought was to remove and pack the 6000 but the rest can ride in place.

Comments/hints/tips?

tnx es 73,

Remove the tubes and pack separately. Be sure all the decks are securely fastened to the cabinet, strap it securely to a pallet after padding with moving blankets and load it up.

if it's gonna be on a pallet, use a forklift.

I suppose you -could- remove each deck if you were in a van or something with a padded floor/back-seat but if it's gonna be in the back of a truck - use a forklift to get it there, after it was strapped to a pallet. Wrap it in a couple of moving blankets, then wrap it with a tarp (been rather wet up in NY lately) for weather proofing.

.....

When my 610I came home it was in a Jeep SUV. We stood a piece of 3/4" plywood against the back bumper, pushed th 610 against that, tipped it backwards then slid it into the vehicle. It was like having the transmitter on a gurney. It worked great with two people and a 610 but a 368 is a 'tad' bigger. I rented an enclosed Uhaul to drag the SRT-15A home, lower than a pickup truck. All the drawers got pulled on that trip , refrigerator and piano dollies sure helped. I think the SRT weighs about the same as a 368 just a different shape.

73 and good luck with the move!

With all my big transmitters I have always removed at least the power transformer prior to moving.

Furthermore, I have moved them all by myself - including the broadcast rigs, GPT 750, T3 and the "little 610."

But certainly get some friends to assist if needed. Pick them wisely - those who have moved these things before are preferred.

And of course remove the tubes. I did not do this once with a BTA-1R1 and all 4-400's were rendered useless in the move.

My 1937 home brew uses HF-300's not an easy tube to replace !

For me, the key was reducing the weight to a manageable amount so as not to have a blow out !

Most of all, take your time and plan the move . If something doesn't seem right during the move stop and rework the situation.

Gud luck and be safe.

Having moved my T-368 and 610s I've found using a appliance hand truck and a come along to be most helpful. I have my 72 chevy ½ ton to do the hauling. I've removed the power supply on the 368 which made loading easier. Strapping the 368 onto the appliance hand truck and affixing the come along onto the hand truck and securing the other end onto the truck I 'winch' it up slowly onto the truck and do the reverse to unload. This set up has worked well for me with other related BA gear..though moving the FRT 17 & 18 was a whole lot different.

Good luck with the move , just take it slow , and think out ahead of time what you are going to do before you get things in motion. And having another person to help is a good idea too.

I have moved two T-368's several hundred miles each. I can't visualize a set of handtrucks, typically found in a home, that could accomodate 640 pounds of T-3 metal. If you could get the load onto the handtruck, I doubt that one man could tilt them backward in order to roll forward. A couple of inches to low and the handles and T-368 and you are going to the ground. Then one man (even if you are an Olympic Weight Lifter) can not lift the load off the ground. If you allow the handtrucks to tilt forward, the whole mess is on the ground again and no one man can move it,

The best way that I have found to move a T-3 is to take all three drawers out and move the unassembled transmitter as four pieces. (You can make multiple trips are utilize multiple vehicles) Caution here- Alone, most of us can't remove even one of the drawers safely. Been there, done that. Now, at this point you have more options. Move all four pieces to the vehicle and no one gets a hernia. (An invaluable tool here, beyond common sense, is a Hydralic Lift Table with rollers). Also, Chevolet Surburban makes a great transport vehicle.

Or locate the cabinet in the transport vehicle. Reinstall and lock the drawers in the cabinet. Secure the assembled transmitter in the transport vehicle. At the destination, reverse the procedure. Take the drawers out, move the cabinet to the desired location and reassemble the drawers. Again, a Hydraulic Lift Table is invaluable.

A fantastic hand truck that many are convinced was designed specifically for Boatanchor moves is the Dutro Brute. KW1I wrote an Electric Radio report in the 90's and had found a rental "appliance dolly".

http://www.elkayprod.com/apptrucks_9.shtml

Chinese knockoffs are available from Northern Tool (not endorsing - just mentioning) . The handle height gives the leverage needed to move the compact T368 or any double sized broadcast transmitter or SRT. The tricycle gear and big wheels help it cover rough terrain.

I've also moved a pair of T-368's several times over the years including a cross country trip in 1999. Agree with Harold the easiest way is to disassemble and and either transport that way or reassemble in the vehicle if you need the space for other stuff. The power supply is the heaviest piece but the cabinet is the hardest to handle because of it's bulk. Have been able to do all by myself with the aid of a hand truck and a home built ramp for getting up into my 1985 G-20 van. Big, strong friends always welcome, of course. And, of course, remove the big tubes and tie everything down securely before taking off down the road.

No big deal, all in all.....

When I delivered the a '610 E model to Perry in Beaumont of course, it
didn't have any tubes in it, or a modulation transformer. That was easy
enough to remove. When I had it slid back to where it was able to be
tipped, I wrapped my arms around it, had it air-borne, and sat it on a
dolly.

...then again, I'm 6'3" (a bit over 3m) tall, and 'healthy' at 275. ;-)

Hi all
.02$ contribution - I 'hired' my brother in law and took all the assemblies out and trucked the individual parts out of the basement (why is it radio rooms are in basements - I guess better than on the third floor....)  I then put the RF and Modulator deck back into the chassis and tipped it into the back of my Explorer.  The power supply took up the remaining space over the folded down rear seat.  Had grunt labor to help wheel into the shack and re-assembled.  I marvel at the guys who move big Collins and Gates heavy metal.

I have moved two T-368's several hundred miles each. I can't visualize a set of handtrucks, typically found in a home, that could accomodate 640 pounds of T-3 metal. If you could get the load onto the handtruck, I doubt that one man could tilt them backward in order to roll forward. A couple of inches to low and the handles and T-368 and you are going to the ground. Then one man (even if you are an Olympic Weight Lifter) can not lift the load off the ground. If you allow the handtrucks to tilt forward, the whole mess is on the ground again and no one man can move it,

The best way that I have found to move a T-3 is to take all three drawers out and move the unassembled transmitter as four pieces. (You can make multiple trips are utilize multiple vehicles) Caution here- Alone, most of us can't remove even one of the drawers safely. Been there, done that. Now, at this point you have more options. Move all four pieces to the vehicle and no one gets a hernia. (An invaluable tool here, beyond common sense, is a Hydralic Lift Table with rollers). Also, Chevolet Surburban makes a great transport vehicle.

Or locate the cabinet in the transport vehicle. Reinstall and lock the drawers in the cabinet. Secure the assembled transmitter in the transport vehicle. At the destination, reverse the procedure. Take the drawers out, move the cabinet to the desired location and reassemble the drawers. Again, a Hydraulic Lift Table is invaluable.

Subject: RE: [T-368_BC-610] Moving a T-368

Having moved my T-368 and 610s I've found using a appliance hand truck and a come along to be most helpful. I have my 72 chevy ½ ton to do the hauling. I've removed the power supply on the 368 which made loading easier. Strapping the 368 onto the appliance hand truck and affixing the come along onto the hand truck and securing the other end onto the truck I 'winch' it up slowly onto the truck and do the reverse to unload. This set up has worked well for me with other related BA gear..though moving the FRT 17 & 18 was a whole lot different.

Good luck with the move , just take it slow , and think out ahead of time what you are going to do before you get things in motion. And having another person to help is a good idea too.

Paul

if it's gonna be on a pallet, use a forklift.

I suppose you -could- remove each deck if you were in a van or something
with a padded floor/back-seat but if it's gonna be in the back of a
truck - use a forklift to get it there, after it was strapped to a
pallet. Wrap it in a couple of moving blankets, then wrap it with a
tarp (been rather wet up in NY lately) for weather proofing.

Next week I'm helping my local museum get their T-368 ready and loaded on a truck bound for the AWA Museum in NY.

I'm certain I've recently seen a photo essay showing T-368 loading, securing, unloading. Can anyone point me towards some photos I can refer to? Two images I recall from the ones I saw...one of the transmitter strapped inside a U-Haul truck and the other of the PS/Modulator deck being slid off the truck on a wooden ramp.

My thought is that this thing was designed to be in the back of a truck...the main thing is to make certain it won't move around and that the decks stay in place. How about the tubes? My thought was to remove and pack the 6000 but the rest can ride in place.

Comments/hints/tips?

Houston and most of South Texas have had less precipitation in the past four month than Tripoli. Of course, some of what's fallen on Tripoli in the past four months has been HBX instead of H2O. We've had none of the former and essentially none of the latter.

Hi All,

I spoke to three amateurs at a hamfest yesterday who own TCS equipment, either TXs or RXs or both, and I met at least one more person there also has TCS equipment. As far as I can tell, there is no dedicated forum for these relatively common radios, which surprised me given their popularity in the US and over here.

At the risk of being accused of re-inventing the wheel, I have set up a Yahoo group for those interested in discussing "all things TCS". As the WS-19 has an extremely popular group and the TBY, BC-610 and ARC-5, amongst other WWII radios, have their own groups I feel I'm not setting a precedent.

# 4545. FS: Original FT243 Crystals

Yahoo group: T-368_BC-610
Date: 2011-05-25 01:34:27 UTC
From: Bry Carling
Topic: 4545  Message: 4545

FOR SALE:

160m, 80m, 40m, 20m, 6m, 2m original, old FT243 rocks... for CW and AM etc.

Several people have asked for the availability of some original amateur band FT243 Crystals.

I do have a limited number of these for 80m, 40m, 20m, 6m and 2m bands.

I have a few more to add yet on 40m - 6m - 2m but the rest are ready...
The list and buying buttons can be found at:

http://www.af4k.com/FT243_CRYSTALS_Originals.htm

# 4548. FS: Tube type preamp with tone controls

Yahoo group: T-368_BC-610
Date: 2011-05-27 21:22:39 UTC
From: Bry Carling
Topic: 4548  Message: 4548

FOR SALE: Tube type preamp / tone controls.

Here is a cool "signal processor" of sorts.

It has those screw-on coaxial mono audio connectors of yore, usually used for mic level signals.

Has two tubes, 6SQ7 and 6SN7. Two Allen Bradley pots with black "chicken head knobs" for bass and treble cut-boost, and has beautiful construction using cloth-covered wire. No AC supply on board but DOES have a dual 20 uF + 20 uF at 450V DC can capacitor. Requires about 250V DC at 25 mA and 6.2V AC at 1A. Includes numerous capacitors and carbon composition resistors.

Small aluminum chassis dimensions: 6.5" X 5.5" X 1" tall.
Overall 4" tall with parts. Pictures available on request.

Available for $15.00 plus shipping.

Thanks & 73 de AF4K, Bry

# 4550. FS: Box of new heavy-duty switches

Yahoo group: T-368_BC-610
Date: 2011-05-29 20:09:25 UTC
From: Bry Carling
Topic: 4550  Message: 4550

FOR SALE: Box of new heavy-duty switches

These are American made heavy duty switches. Mostly new - there are about 12 momentary switches with 4 pole two positions (center off.) Some other 2 pole and 4 pole switches. On large SPST switch - some DPDT fixed and momentary switches. Some of these are momentary, some fixed, and some are rocker switches. Most mount with either 3/8" bushing or two #6 screws. It's a nice assortment. One large ceramic two pole 3-position, dual contacts KW-class rotary switch. Total of 24 switches in the box for $20.00 plus shipping.

For Sale: Power Supply Chokes

1) QTY 1 - 4.5 H at 445 mA and 39 ohms DC resistance
G.E. Dimensions are 5" X 3.5" X 4.5" tall, potted
Available for $10.00

2) QTY 1 - 12H at 150 mA and 230 ohms DC resistance,
STANCOR Dimensions are 3.5" X 2.5" X 2.5" tall, upright type
Available for $8.00

3) QTY 1 - 8H at 150 mA and 150 ohms DC resistance, looks same as
the Stancor Dimensions are 3.5" X 2.5" X 2.5" tall, upright type
Available for $8.00

4) QTY 1 - 20 H at 45 mA and 308 ohms DC resistance, potted.
Military gray, nice. Dimensions 2.25" X 2" X 3" tall.
Available for $6.00

5) QTY 1 - 2H at 50 mA and 60 ohms DC resistance. Upright type
Dimensions 2.25" X 1.5" X 2" tall.
Available for $4.00

Take all of the above and save majorly on shipping costs.
Pictures available on request.

73 & thanks for looking.

FOR SALE: Transformers and Chokes - most of these are new and
a few are nearly new.

Data for most of these is readily available on the internet.

STANCOR P-8356 Power Transformer - PRI 117V AC 60 Cy. black,
upright, nice end bells.
SEC1: 270 - 0 - 270 V AC at 260 mA (540V C.T.)
SEC 2: 5.0 V at 3.0 A
SEC 3: 6.3V at 8.8 A
Like new, posssibly used a little.
Available for $25.00 plus shipping

TRIAD R_56A Power Transformer - Pri; 117V AC 60 CPS
SEC 1: 130V at 20 mA
SEC 2: 30.0V at 0.6A
SEC 3: 22.5V at 0.6A
SEC 4: 15.0 V at 0.6A
(sec 2,3,4 are common) good, used. Nice gray end bells.
Available for $10.00 plus shipping

ALL of the following UTC items are new, old stock - unused
items:

United Transformer Corp. UTC HA114
Gray, potted pp low level plate to multiple line PRI: 30k p-p
at 1mA, unbal DC,
SEC: 50, 125/150, 200/250, 333, 500/600 ohms RESP: 30Hz -
40kHz +23dBm max.
Available for $15.00 plus shipping

hello guys, i am fairly certain that the trouble with my BC610 is the phone /cw switch. on cw if you go to transmit, it is key down all the time. also, in phone, the sidetone is on continuously when you transmit , and has to be switched off on JB70 .i have tried disconnecting the cable to JB70, and it is still the same. does anyone have a spare switch ? i am also after some original screw fasteners for the back cover.; i made some, but it would be nice to have originals. alan G4GEN

Alan,

The only thing the CW/Phone switch on the front of the BC-610 does is select the Plate voltage. The Phone/AM PA Voltage is 2000. The CW Plate voltage is 2500.

You've got something else messed up.

yes bob , you are right. i had a better look at the schematic after i sent that one. it has to be a couple of the connections on the TS2 tag board.i suspect 11 and 12. if i recall correctly, they are long wires which come from a different area than the others.i am going to swap them round today. the trouble is that you need to be a contortionist to work on it in the shelter ! at my age i find lying on my side bent double is a bit taxing. still it has to be done.
when this is resolved all we really need is a replacement generator for the PE95 . our one was converted to 220v 3 phase after the war for use as a standby power unit at a flower growers . a lot of them were done like that. when at a show we use a large auto transformer to run the station from it . as the engines are jeep engines, occasionally you see them going less engine, which would suit us.
i do not know if you know the history of our truck . it came from luxembourg. we contacted their military museum, and as far as they know it was used during the ardennes offensive , and left behind there along with a lot of non combatant stuff when your guys were chasing the germans back home. later it was given to them. it was last used in the sixties. we have message pads found in a receptacle confirming this.it is like a time capsule. the speaking tube is still in place . there is also a spare one ! alan

# 4565. T-368 preamp

Yahoo group: T-368_BC-610
Date: 2011-06-30 08:47:18 UTC
From: Mike Feher
Topic: 4438  Message: 4565

I have been asked for years to share a photo of how I did this, and, it was almost impossible. By sheer coincidence I came across a 25 year old Polaroid photo of my preamp just recently. I did this about 25 years ago, soon after I obtained and re-built my T-368F. This is the well know RCA preamp circuit made popular by an N9 whose call and name I regrettably forgot, but used to talk to often on 160 AM. I decided to scan the photo and share it, before I lose it , and who knows when my basement will allow me access to my T-368 again. The way I did it was to totally gut the original preamp/processor module and build up my circuit on a blank piece of aluminum. I cut the top off of the original chassis and the aluminum soldered my chassis on the frame. I also used the original connector, so, the existing one just plugs right in. Of course, the chassis fits just like it did before. I used a piece of Teflon for the divider network required for the feedback to the 4-125s. Unfortunately, all of my documentation was disposed of when they were ruined in my basement flood a little over 3 years ago. The photo of the implementation is now uploaded to the N4FS folder for this group. 73 - Mike

From: Bry Carling
Topic: 4567  Message: 4567

FOR SALE: CRYSTAL OVENS

QTY 2 -  COMCO Octal OCTAL plug-in type crystal ovens. These are made to hold
TWO hc6u crystals, and include retakner hardware 12 Volt operation.
QTY 2 available for $3.00 each

Shipping additional

I have some other crystal ovens here somewhere. Will hunt for them if anyone is interested.

73 - Bry, AF4K

Did you try disconnecting the rectifier from the transformer ?

Do that and apply power again to see if the transformer is really kaput.

It could be just  a matter of a shorted choke or caps.

Just a thought .

# 4569. T-368 Rochester to Rochester

Yahoo group: T-368_BC-610
Date: 2011-07-02 17:50:56 UTC
From: Roy
Topic: 4512  Message: 4569

Having just been approved for this group I wanted to introduce myself.
,
I am Roy Wildermuth W2IT. I am the Asst Curator of The AWA Museum. My wife and i underwrote the cost of shipping the T-368 and I am now beginning work on restoring it. We used YELLOW freight and the shipping cost was $467.00. Not bad in my opinion.

I plan on writing about my work in getting this beauty on the air.

To date I have installed a 30 Amp 115 Volt line. The radio powers up but no Hi-Voltage appears beyond the Hi Pot power supply. Probably a interlock.

We previously restored a BC-610 so a membership in the group will be a real treat !

Anyway, I begin this weekend on the T-3

Thanks again to the guys in Rochester MN. You all did a great job !

Roy Wildermuth
AWA Museum

Can you hear the exciter in a nearby receiver? If so, check that the exciter output is patched over to the PA grid. If the rig was previously used for RTTY the exciter output would have been internally patched over to one of the connectors on the front, LH side of the RF deck. If you can't hear any exciter signal something's wrong in the exciter chassis or LMO.

From: Trevor
Topic: 4579  Message: 4579

Just an additional "Amen" to the comment about importance of safety around high tension RF-

Back when I was a daydreaming teenager I rescusitated a 100 W Collins ART-13 that had been sitting in someone's barn for several decades. As it was finally coming together in function,
I had the lid off but the disconnects jumpered in order to take some readings as it transmitted
into a dummy load. Then I unkeyed it intending to take some more measurements, but somewhere
(forget where) the keying circuit was still completed. I was deep in thinking about the readings I was seeing and what they indicated.

One of my fingers got in the vicinity of the high-impedance end of the tank
circuit as I was putting a voltmeter probe on something else nearby -- I was nowhere near touching the tank components, but close enough that in a split second an RF arc longer than I'd
have ever thought possible "reached out and touched" my thumb, instantaneously burning an RF
hole deep into the tissue. I'm really darned lucky that it healed OK and that no other parts
of me were involved in that inadvertent completion of a circuit. In hindsight, was I distracted and foolhardy- absolutely-- but I also experienced the surprise [even though I knew
the theory in the abstract] that potent RF can do some interesting and intense things that one
does not expect when so much of the "hands on" learning one has probably done involves dynamics
associated with DC or relatively low frequency AC.

73 and bravo for the work you are doing (and sharing your experience with)

Jim

I am not working on the T-368 plugged in. I merely strapped the interlocks due to the fact that they were not functioning. I do not open it without it being unplugged.

Since you are the expert I would bend your year for this.

(a) When I first go T-3 The power would go on, both blowers and filaments. Meter indicated heater voltage. Red light would go on when Hi voltage breaker was turn on and the plate relay switch was thrown. There did not appear to be any Hi Voltage. Nothing showed on the multimeter. And the PTT would not trigger the red light.

(b)Then I strapped the Interlock in the center of the rear of the modulation deck. The red light would then go on with PTT and there appeared to be HI. No Grid and no exciter signal. There appeared to be activity in the modulator when I spoke into the mic. Int Plate X10 pinned on the meter. Thought I hear some arcing.

Last night I strapped the Interlock on the RF deck.

Nothing, back to zero.(a)

Strapped the small interlock switch in the right front of RF deck. Back to (b) except no activity on Int Plate x10

Looking at the Exciter I see that there are 2 BNC jacks on the exciter chassis near the PTO that are not connected.

This is how far I have gotten.

Roy W

I would love to find someone who would come and look this over or chat on the phone. I would be glad to pay, but I have found no one yet. We tacked a BC-610 but did have an experienced person. The T-3 is a pain due to the size and the high voltage.

Nah, first things first.

Check the "files" section of this website and read all of the "start-up" procedures there. You will find information on the interlock system and some of its problems.

The interlock on the upper right of the RF deck can be operated by pulling the plunger OUT, so you can troubleshoot the RF deck, to some extent, under power.

I would be surprised if you did NOT have interlock problems.

YES!  So was mine.  Make sure everything is plugged in, too.

You may want to re-connect that same wiring so you can see the exciter output on a scope using the external BNC connector on the front panel.

# 4589. BC-610 and T-368 Registries

Yahoo group: T-368_BC-610
Date: 2011-07-07 20:49:06 UTC
From: rbethman
Topic: 4585  Message: 4589

Neither Database is open to the members to create or modify entries.

I, N0DGN, Bob, stepped up and took the BC-610 Registry.

I have access to the T-368 Registry also, so I just discovered.

So throw those to me direct also!

Bob - N0DGN

Roy,

Very carefully check the HV wiring under the power supply deck near the 3B28's if it is cracked at all it will arc on transmit.  Also, there are two spark-gaps on the HV caps under there, check that they are adjusted properly.

You really need to get a manual for this before you put power to it.  You should have done a LOT of cleaning to prevent arcs on the HV components.

Joe

I have strapped out two of the interlocks. I now have PTT but no Grid drive or exciter signal. I found that the interlock on the upper right side of the RF deck was not making contact so I strapped that. I am hoping against hope that it is an interlock problem. But still no exciter.

I'm afraid there might already be damage done, by trying to key the thing up and talk to it.

The arc'ing you probably heard, was the modulation transformer shorting while producing 100+% output into ... no load (because of no B+ on the final).

Step by step. pull out the power supply drawer, and address any and all components in it.

Pull out the Modulator drawer and check the tubes and all transformers and capacitors on that deck, then

pull out the final PA deck and do the same to it.

Each deck will probably take -at least- a good 8 hours to completely go through and check, and the toughest is gonna be the final.

There's more to these ol' rigs than squeezing a button and talking into a microphone.

Yep! They even had one based at Arecibo in the late 60s.

They got more use than folks know. My second one is a T-213, and it is a "slightly" modified BC-610I. Date stenciled on the front says it went through depot in Jul 1959.

That should give some idea that they were intending on continued life.

i should not surprised that they went on so long really. what finished them was the need for ssb. they gave 350 watts of reliable power , were already long since paiid for , and were cheap to maintain as spares were available in large quantities. using our scr399 truck i have worked all round europe and as far as central russia on the whip antenna . it is a bit like the DC3 . any replacement has to be a great deal more costly . alan G4GEN

GOOD!  Cleaning also helps you get familiar with it, and the locations of its components. It also is a chance to find any modifications,.... good of bad.

And then there  is the missing parts, too.

Hi All,

Whilst running up my collection of TU tuning units I noticed that when the TU-49 (for 80 metres) is in the rack the three voltage regulator tubes seem a lot dimmer than when I have a TU in for Top Band or 40 metres.

This looks to be related to the load on the exciter power supply, as if I remove the crystal from the TU-49 the VRs come up to full glow, and switching to MO dims them again. The same happens if I tune the two stages on the TU to off-resonance. The VRs are not totally dimmed out on the TU-49, they are just markedly dimmer than the other TUs. A spare TU-49 gives the same result - as does swapping TU slots. There's no obvious overheating or nasty smells coming from the exciter deck and meter readings seem about normal.

My question is, is this a possible fault condition or is it something that others have noticed? I am running the BC-610-E from a 230 to 110V step-down transformer and our domestic supply is 50Hz in the UK. Given that, this could just a be low exciter B+ issue. Where on the exciter would be the best point to take a voltmeter reading from? I am in the process of making up an octal tube extender to allow V & R measurements with the CO and BA tubes in situ.

Just a follow-up: the voltages are correct on the screen and plate of the 6V6 Co/MO tube and the voltages are stable, so the VR tubes are doing their job OK.

> This looks to be related to the load on the exciter power supply, as if I remove the crystal from the TU-49 the VRs come up to full glow, and switching to MO dims them again. The same happens if I tune the two stages on the TU to off-resonance. The VRs are not totally dimmed out on the TU-49, they are just markedly dimmer than the other TUs. A spare TU-49 gives the same result - as does swapping TU slots. There's no obvious overheating or nasty smells coming from the exciter deck and meter readings seem about normal.
>
> My question is, is this a possible fault condition or is it something that others have noticed? I am running the BC-610-E from a 230 to 110V step-down transformer and our domestic supply is 50Hz in the UK. Given that, this could just a be low exciter B+ issue. Where on the exciter would be the best point to take a voltmeter reading from? I am in the process of making up an octal tube extender to allow V & R measurements with the CO and BA tubes in situ.

Roger,

Check the 807s and see what they look like. These come after the 6V6
and 6L6.

From: Alan Morriss
Topic: 4367  Message: 4616

hello guys, well , the BC610 is back in business. i feel a bit stupid. it was only the door over the exciter section . the screws on the target were a bit loose. my fault when i put it back together. i somehow overlooked the red light not being on . i am going to try 20 metre cw for a bit , so we may be able to work BC610 to BC610 across the pond. i will be around 14 020 . the standard 15 foot whip should be ok on that frequency . it will save going up a tree to fix an anchorage for the long wire. alan G4GEN

Hi Bob,

Well, the 807s both test OK and substituting them with other good examples made no difference to the VR tubes "glow level".

Tested all three VRs by substitution and no change but I did fall into the trap that if you leave one or more VR tubes out then you don't get any filament power on the exciter tubes or the 250TH! The filament transformer primary is wired through three links on the VR tube bases and if one is missing the deck won't power up, a sensible safety device, I suppose, to protect the tubes from over-voltage or the PA from lack of drive?

Exciter B+ is 450V off-load and drops to about 380ish with a tuned-up TU unit in place. Tried a new 5Z3 as well, no change. There's no sign of overheating on the deck or inside the TU (a spare TU-49 gives the same results).

So, the plate and screen voltages on the 6V6 oscillator are as they should be, so I will continue until something goes obviously wrong!

73,

Roger/G3VKM

Shouldn't be too had to find a replacement, 2.5 mh @ 500ma RF choke
(from TM-11 280). Looks like a Hammarlund CH-500. Johnson 752 should
be OK too, ditto National R-152 or R-154.

Topic: 4623  Message: 4623

hello guys, when i unwound the choke, i think i found the cause of the failure. the actual mechanism must have been series resonance , but the inductance must have been chosen for it to fall outside the frequency range of the BC610. however in this one there was a winding fault . the choke is in four sections, the two outers being thinner than the inners. the winding of one of the inners at the bottom overlapped into the other , so it was in effect one winding for about half of the thickness.
i suppose these things happen in wartime. it was much worse for the germans with their use of slave labour. a german pilot told me about some . hitler decided to have the me 109 to be fitted out as a fighter/bomber. when the great day for the demonstration arrived all the top brass were watching. the aircraft dived , dropped the bomb and pulled up . at this point both wings folded upwards . on examination of the wreckage they found that half the wing bolts had been made of lead. it had been built in the nord factory near paris. he also told me about when he had been shot down over the mediterranean south of marseilles . a focke wulf condor appeared and he tried to fire a flare from his very pistol. he tried furiously, and nothing happened. the aircraft flew on . on examination , the hole for the firing pin was a tiny bit smaller than the pin itself. he drifted ashore two days later. they also used to pee on the gyros for the v2 rockets. this was initially undetectable , but rapidly produced corrosion. the results were somewhat interesting at launch time , and the germans never found out . i must point out that despite being on the receiving end of some of it , i am a great admirer of german ww2 technology . my most treasured posession is a teelefunken e52 a made in 1943. alan G4GEN

Topic: 4626  Message: 4626

We are restoring a BC-669D (SCR-543D) Radio at the Ft. MacArthur Museum in San Pedro, CA. and are in need of one (or more) Klixon C-6363, 4 amp AC circuit breakers. Three of these units are used in the PE-110D power supply for the unit and the bakelite handle on one of the breakers in our PS is broken off. Earlier PE-110s ( A, B & C) used fuses but ERL switched to the use of breakers in their later SCR-543 models (or at least in the PE-110 we have).

Pix available on request.

Any and all help much appreciated.

# 4628. FS: 455-457 kHz crystals etc.

Yahoo group: T-368_BC-610
Date: 2011-09-02 14:52:58 UTC
From: Bry Carling
Topic: 4628  Message: 4628

FOR SALE:

As used in the BC-684 military transmitter.

These are the closest you can get to 455 kHz in FT241 crystals and great for making i.f. filters, BFOs etc.

Quantity 7 - Channel 327 - 32.7 MHz / 454 to 455 kHz crystals, Type FT241,
and also Quantity 1 - Channel 329 - 32.9 MHz / 457 kHz

Will only sell these all as a group (all 8) for $22.00 plus shipping

ALSO:

FT243 Crystal on 2000 kHz - $14.00
FT243 Crystal on 5000 kHz - $14.00

hc13/u frequency standard (like tall hc6u metal can crystals) - $19.00 each

QTY 10 - 1843 kHz crystals - type hc33/u with wire leads (like hc6u) - $2.00 each
QTY 12 - 3742 kHz crystals, type hc6/u metal can, thin pins. - $2.00 each

Shipping additional.

Thanks for looking - Bry, AF4K

= = =

# 4629. 866 vs 3B28 in BC-610

Yahoo group: T-368_BC-610
Date: 2011-09-04 16:00:57 UTC
From: Roger Basford
Topic: 4629  Message: 4629

Hi All,

Is there any advantage in using the 3B28 xenon rectifier over the 866A? How about forward resistance, is it less - if so you should get more volts out? How about watm-up time?

One of the 866s in my TX has a loose base and, rather than just change it for a spare, I thought this might be an opportunity to try a pair of 3B28s I picked up at a hamfest earlier this year.

Looking at the manual, the 3B28 is shown as a direct replacement for the 866A.

Any info appreciated.

Roger/G3VKM Norfolk, England.

Roger,

The differences in forward voltage drop are insignificant in the BC-610.
The only advantage I can recall is that 3B28's are less prone to flash-over
from insufficient warmup time at low temperatures. Which can be a
significant advantage (but not in South Texas this summer!).

Roger,

That specific "change" was made by the U.S. Army Signal Corps. They went directly from 866s to 3B28s. It is in the Change history of these old girls. ALL the later models came out direct from factory with the 3B28s.

You can swap out the 866s and have fun! No other changes necessary.

Probably run a little cooler, and no delay in going to full power. Xenon gas totally different response than heating mercury to vapor state before applying HV.

They are indeed a drop in replacement. I use them for all my rigs that use 866s. Have had excellent results with the 4B32 replacement for the 872, same principal. Flash over issues are gone, fewer fuses blown, and so on. They have more of a violet glow vs. the blue of the 866s, and they sure make life a lot easier with these old rigs.

Hi All,

Thanks for the swift responses! I have gone ahead and swapped to the 3B28s and all is fine, although the antenna (shorting) relay which has been buzzing rather badly over the past few months seems to have finally given up the ghost, maybe it doesn't like this 50Hz AC we use over here :-))

Anyway, with the relay jammed open, the rig produces full power and the overload trips off-resonance without any nasty noises or smoke. I will try a soak-test once I've fixed the relay. Pleased with the 3B28s, as I only paid 1 GB pound each for them and they were NIB.

Thanks again,

Roger/G3VKM

Roger - They are usually cheaper and more plentiful too!

I purchased spares, and have yet to use a single one.

Bob - N0DGN
